**Mark scheme**

Specimen

---

Mark schemes are prepared by the Lead Assessment Writer and considered, together with the relevant questions, by a panel of subject teachers. This mark scheme includes any amendments made at the standardisation events which all associates participate in and is the scheme which was used by them in this examination. The standardisation process ensures that the mark scheme covers the students' responses to questions and that every associate understands and applies it in the same correct way. As preparation for standardisation each associate analyses a number of students' scripts. Alternative answers not already covered by the mark scheme are discussed and legislated for. If, after the standardisation process, associates encounter unusual answers which have not been raised they are required to refer these to the Lead Assessment Writer.

It must be stressed that a mark scheme is a working document, in many cases further developed and expanded on the basis of students' reactions to a particular paper. Assumptions about future mark schemes on the basis of one year's document should be avoided; whilst the guiding principles of assessment remain constant, details will change, depending on the content of a particular examination paper.

Further copies of this mark scheme are available from [aqa.org.uk](http://aqa.org.uk)

## Level of response marking instructions

Level of response mark schemes are broken down into levels, each of which has a descriptor. The descriptor for the level shows the average performance for the level. There are marks in each level.

Before you apply the mark scheme to a student's answer read through the answer and annotate it (as instructed) to show the qualities that are being looked for. You can then apply the mark scheme.

### Step 1 Determine a level

Start at the lowest level of the mark scheme and use it as a ladder to see whether the answer meets the descriptor for that level. The descriptor for the level indicates the different qualities that might be seen in the student's answer for that level. If it meets the lowest level then go to the next one and decide if it meets this level, and so on, until you have a match between the level descriptor and the answer. With practice and familiarity you will find that for better answers you will be able to quickly skip through the lower levels of the mark scheme.

When assigning a level you should look at the overall quality of the answer and not look to pick holes in small and specific parts of the answer where the student has not performed quite as well as the rest. If the answer covers different aspects of different levels of the mark scheme you should use a best fit approach for defining the level and then use the variability of the response to help decide the mark within the level, ie if the response is predominantly level 2 with a small amount of level 3 material it would be placed in level 2 but be awarded a mark near the top of the level because of the level 3 content.

### Step 2 Determine a mark

Once you have assigned a level you need to decide on the mark. The descriptors on how to allocate marks can help with this. The exemplar materials used during standardisation will help. There will be an answer in the standardising materials which will correspond with each level of the mark scheme. This answer will have been awarded a mark by the Lead Examiner. You can compare the student's answer with the example to determine if it is the same standard, better or worse than the example. You can then use this to allocate a mark for the answer based on the Lead Examiner's mark on the example.

You may well need to read back through the answer as you apply the mark scheme to clarify points and assure yourself that the level and the mark are appropriate.

Indicative content in the mark scheme is provided as a guide for examiners. It is not intended to be exhaustive and you must credit other valid points. Students do not have to cover all of the points mentioned in the Indicative content to reach the highest level of the mark scheme.

An answer which contains nothing of relevance to the question must be awarded no marks.

### **Assessment of spelling, punctuation, grammar and use of specialist terminology (SPaG)**

Accuracy of spelling, punctuation, grammar and the use of specialist terminology will be assessed via the indicated 9 mark questions. In each of these questions, three marks are allocated for SPaG as follows:

- **High performance** – 3 marks
- **Intermediate performance** – 2 marks
- **Threshold performance** – 1 mark

Qu	Part	Marking guidance	Total marks
----	------	------------------	-------------

**Question 1 The challenge of natural hazards**

01	1	<p>One mark for idea of steady increase followed by rapid rise in CO<sub>2</sub> levels/exponential rise.</p> <p>Second mark for use of data shown on graph or for data manipulation, eg CO<sub>2</sub> concentration increased by almost 100 ppm in 150 years.</p> <p>No credit for increase in CO<sub>2</sub> levels without qualification.</p> <p>AO4 = 2 marks</p>	2
----	---	--	---

01	2	<p>Credit <b>one</b> reason only. Valid developed point awarded 2 marks.</p> <p>One mark for appropriate reason, eg</p> <ul style="list-style-type: none"> <li>• burning of fossil fuels (1)</li> <li>• manufacturing of products like cement (1)</li> <li>• deforestation (1).</li> </ul> <p>Allow natural factors such as volcanic activity (1).</p> <p>Second mark for developed reason, eg</p> <ul style="list-style-type: none"> <li>• thermal power stations burn fossil fuels which release gases including carbon dioxide which build up in the atmosphere (2).</li> </ul> <p>AO2 = 2 marks</p>	2
----	---	---	---

01	3	<p>One mark for each correct answer:</p> <p><b>C</b> Temperatures over most of the sea areas north of 60° N are expected to increase by 4 °C</p> <p><b>D</b> Temperatures over the whole of Africa are likely to rise by 3 °C or 4 °C.</p> <p>No credit if three or more statements are shaded.</p> <p>AO4 = 2 marks</p>	2
----	---	--	---

Level	Mark	Description										
2 (Clear)	3-4	<p>AO3 Demonstrates accurate interpretation of weather conditions through the application of relevant knowledge and understanding to the resource.</p> <p>AO4 Makes clear and effective use of the satellite image to support the forecast of weather conditions.</p>										
1 (Basic)	1-2	<p>AO3 Demonstrates some interpretation of weather conditions through the application of limited relevant knowledge and understanding to the resource.</p> <p>AO4 Makes limited and piecemeal use of the satellite image to support the forecast of weather conditions.</p>										

		<p>conditions.</p> <ul style="list-style-type: none"> <li>• Cloud cover will increase over the next few hours and wind speed will pick up dramatically as the outer part of the vortex approaches. Winds, which will be blowing from the east, may be damaging and there will be torrential downpours of rainfall from dark cumulonimbus clouds. There is a possibility of tornadoes and thunderstorms with lightning. A storm surge combined with the heavy rain may cause dangerous flooding in low-lying coastal areas. Air pressure will drop rapidly.</li> <li>• This will be followed by the centre of the storm or 'eye', which will only last for a short time. The weather is likely to be fairly calm with only light winds and fair weather.</li> <li>• The winds will again increase suddenly as the second part of the vortex approaches. This will be accompanied by powerful winds blowing from the west, with further heavy rain. Air pressure will rise as the storm continues northwards, and cloud cover will then become thinner, with more moderate winds. Eventually the rain will cease, although further belts of showers will occur as the storm moves away.</li> </ul> <p>The focus is on weather conditions. No credit for describing the structure of the storm, its causes or responses.</p> <p>As the forecast is for 24-hours, allow differing interpretations about how far the tropical storm may move. Credit partial sequence to the top of Level 2 if clear and valid forecast is produced.</p> <p>No credit for descriptions unrelated to the image.</p> <p>Answers must apply understanding of the features of tropical storms to interpret the resource.</p> <p>AO3 = 2 marks, AO4 = 2 marks</p>	
--	--	---	--

01	8	<p>One mark for each reason showing understanding of the frictional effect of moving over the land, eg they pass over land which slows their movement due to friction, or of loss of energy due to cooling effect of passing over water (or land) at higher latitudes, eg they move into areas of cooler water, where there is less energy.</p> <p>No credit for vague statements such as 'mountains stop them' or 'they pass over the sea'.</p> <p>AO2 = 2 marks</p>	2
----	---	---	---

01	9	9
<b>Level</b>	<b>Marks</b>	<b>Description</b>
3 (Detailed)	7–9	<p>AO1 Demonstrates detailed knowledge of the primary and secondary effects of a tectonic hazard on people and the environment.</p> <p>AO2 Shows thorough geographical understanding of the interrelationships between places, environments and processes in the context of a tectonic hazard.</p> <p>AO3 Demonstrates application of knowledge and understanding in a coherent and reasoned way in evaluating the relative significance of primary and secondary effects on people and the environment.</p>
2 (Clear)	4–6	<p>AO1 Demonstrates clear knowledge of the primary and secondary effects of a tectonic hazard on people and the environment.</p> <p>AO2 Shows some geographical understanding of the interrelationships between places, environments and processes in the context of a tectonic hazard.</p> <p>AO3 Demonstrates reasonable application of knowledge and understanding in evaluating the significance of primary and secondary effects on people and the environment.</p>

1 (Basic)	1–3	<p>AO1 Demonstrates <del>very</del> limited knowledge of locations, places and processes in relation to a hot desert/cold environment.</p> <p>AO2 Shows slight geographical understanding of the interrelationships between places, environments and processes in the context of a hot desert/cold environment.</p> <p>AO3 Demonstrates limited application of knowledge and understanding in evaluating the extent to which a hot desert/cold environment provides opportunities and challenges for development.</p>
	0	No relevant content.
<p><u>Indicative content for hot deserts</u></p> <ul style="list-style-type: none"> <li>• The question requires consideration of the extent to which a hot desert area provides both opportunities and challenges.</li> <li>• Answers may focus on the nature of economic opportunities, the scale of development and control over the inhospitable conditions.</li> <li>• Opportunities include resource exploitation relating to</li> </ul>		

		<p>agriculture, recreation and tourism. Economic benefits include employment, spending in the local economy, multiplier effect, and improved infrastructure. Many hot desert environments are increasingly important economically.</p> <ul style="list-style-type: none"> <li>• Challenges include environmental constraints, costs/remoteness, and conflicts with indigenous populations.</li> <li>• Relationships exist between the nature of the challenges and the desire/ability to overcome them in order for development to take place. This might reflect, for example, the value of resources and the technological advances enabling their exploitation.</li> <li>• Support for answers may be based in poorer or richer parts of the world. In HICs, south west US may be used. Economic activity may focus on water supply and how it is managed, provision for commercial farming, mining activity, supplying water, possible provision of a power source to facilitate development, development of tourism on a large scale, building areas for retirement.</li> <li>• In LICs, areas such as the Thar Desert may be cited. Economic activities include subsistence farming, including nomadic pastoralism, and hunter-gathering. Commercial farming supported by irrigation may be emphasised. Resources such as limestone and gypsum are found in this desert, valuable for the building industry. Hydroelectric power is supplied. Tourism is a growing industry.</li> </ul> <p>No credit for management of hot desert environments.</p> <p><u>Indicative content for cold environments</u></p> <ul style="list-style-type: none"> <li>• The question requires consideration of the extent to which a cold environment provides both opportunities and challenges.</li> <li>• Answers may focus on the nature of economic opportunities, the scale of development and control over the inhospitable conditions.</li> <li>• Opportunities include resource exploitation, including agriculture, recreation and tourism. Economic benefits include employment, spending in the local economy, multiplier effect, and improved infrastructure. Many cold environments are increasingly important economically.</li> <li>• Challenges include environmental constraints, costs/remoteness, and conflicts with indigenous populations, extreme low temperatures, low precipitation, variable daylight hours, permafrost/active layer, fragile ecosystems, and relief barriers. Construction disrupts and melts the permafrost, creating unstable ground. Exposure to extreme cold can injure and kill, and healthcare may be many miles away. Restricted employment opportunities are a real problem for people living in remote areas, and there is a lack of services due to low population density. Climate change may lead to widespread and rapid changes which are difficult to adapt.</li> <li>• Relationships exist between the nature of the challenges and the desire/ability to overcome them in order for development to take place. This might reflect, for example, the value of</li> </ul>	
--	--	---	--

		<p>resources and the technological advances enabling their exploitation.</p> <ul style="list-style-type: none"> <li>• Credit answers that focus on Arctic or Antarctic regions. Allow reference to tundra as well as polar areas. Support for answers may be based on Northern Canada and/or Alaska. Drilling and mining activities occur, there is considerable hydroelectric power potential, large parts of the coastline offer wind and geothermal energy potential and the region has a large seafood fishing industry.</li> </ul> <p>No credit for management of cold environments.</p> <p>AO1 = 3 marks, AO2 = 3 marks, AO3 = 3 marks</p>

	0	No relevant content.																
<p><u>Indicative content</u></p> <ul style="list-style-type: none"> <li>• Responses should analyse the map, finding connections and providing a logical chain of reasoning.</li> <li>• The question implies knowledge of the processes of transportation and deposition as well as landform(s) of deposition. Emphasis is on explanation, so processes should be outlined as well as the sequence of formation.</li> <li>• In the specification the relevant landforms are beaches, spits and bars, but credit other variations such as tombolos and barrier islands.</li> <li>• The landforms are created by the process of longshore drift. Some eroded material is up caught up within the waves and is carried by the sea along the coastline. Material is carried along the shore in a zigzag fashion by waves as they swash material up the beach at an angle and backwash material down the beach at a right angle. The angle of swash is determined by the prevailing wind. On the map the direction is from west to east as shown by the prevailing wind, and the shape and growth of the spit.</li> <li>• Credit processes of transportation such as traction, saltation and suspension.</li> <li>• Allow labelled diagrams as part of the explanation of processes and landforms.</li> <li>• Spits are formed by longshore drift in areas of relatively shallow and sheltered water where there is a change in the direction of the coastline. Deposition occurs, resulting in the accumulation</li> </ul>																		

		<p>of sand and shingle. The material initially deposited is the largest material, dropped due to the reduction in energy.</p> <ul style="list-style-type: none"> <li>• A bay bar may develop across the entrance to a bay and eventually join two headlands due to transport of sediment by longshore drift.</li> <li>• Beaches are areas of sand, pebbles and shingle that are formed by deposition produced by wave processes and by longshore drift. Steeply sloping beaches are formed by strong destructive waves that backwash more material away from the beach than they swash up the beach. Gently sloping beaches are formed by constructive waves that swash more material up the beach than they backwash away, building up a steep beach gradient.</li> </ul> <p>AO1 = 2 marks, AO2 = 2 marks, AO3 = 2 marks</p>	
--	--	---	--

**Question 4 River landscapes in the UK**

04	1	<p>One mark for identifying appropriate characteristic evident in grid square 4754, eg</p> <ul style="list-style-type: none"> <li>the river meanders (1)</li> <li>the river flows from south west to north east across the area of the grid square (1).</li> </ul> <p>No credit for features of the river banks, eg levées, or the surrounding floodplain.</p> <p>AO4 = 1 mark</p>	1
04	2	<p>One mark for the correct answer:</p> <p>32 metres (m). Must include units.</p> <p>AO4 = 1 mark</p>	1
04	3	<p>One mark for statements which show understanding of the gradient of the river, eg concave shape/steep in the upper course (1), gentler slope in lower course (1).</p> <p>No credit for statements about the cross profile, eg steep banks at the beginning, flatter in the lower course.</p> <p>AO4 = 1 mark</p>	1
04	4	<p>Answers must suggest <b>one reason</b> for the decrease in slope angle of valley sides, based on an interpretation of the information provided, eg</p> <ul style="list-style-type: none"> <li>the valley sides become less steep because of the effects of mass wasting and weathering (1)</li> <li>near the source the river cuts downwards, but further downstream it is eroding laterally (1).</li> </ul> <p>No credit for description of changes in valley profile between A and B.</p> <p>AO3 = 1 mark</p>	1
04	5	<p>One mark for showing the general idea of attrition, eg</p> <ul style="list-style-type: none"> <li>particles in the river may collide with each other (attrition) (1)</li> <li>gradually become smaller in size (1).</li> </ul> <p>No credit for answers that do not explain the mechanism, eg rocks break up.</p> <p>AO1 = 1 mark</p>	1

04	6	4												
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Level</th> <th style="width: 15%;">Marks</th> <th style="width: 70%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">2 (Clear)</td> <td style="text-align: center;">3–4</td> <td>                     AO2 Shows clear understanding of how river flooding has economic effects. AO2 Shows limited geographical understanding of the interrelationships between environments and processes.		0	No relevant content.	6
		Level	Marks	Description																
		3 (Detailed)	5-6	AO3 Demonstrates thorough application of knowledge and understanding to analyse geographical information, giving detailed explanation of formation of the features shown  AO3 Makes full analysis of the resource, using evidence to support response.																
		2 (Clear)	3-4	AO1 Demonstrates specific and accurate knowledge of river processes and environments.  AO2 Shows thorough geographical understanding of the interrelationships between river environments and processes.																
		1 (Basic)	1-2	AO1 Demonstrates some knowledge of river processes and environments.  AO2 Shows limited geographical understanding of the interrelationships between environments and processes.																
	0	No relevant content.																		
<p><u>Indicative content</u></p> <ul style="list-style-type: none"> <li>• Responses should analyse the photograph, finding connections and providing a logical chain of reasoning.</li> <li>• The question implies knowledge of fluvial processes, and their interrelationship with the landform(s) created. Emphasis is on explanation, so processes should be outlined as well as the sequence of formation.</li> <li>• Processes include the erosional processes of hydraulic action and abrasion or corrasion. Erosion is most rapid during powerful flood events. Credit transportation processes such as traction and saltation as well as processes of deposition as evidenced in the large debris to the right of the channel in the foreground. Mass movement processes may be relevant in the context of valley formation.</li> <li>• A waterfall with plunge pool, and a steep sided valley or gorge is clearly visible. Credit reference to the more gently sided valley in the background, above the waterfall.</li> <li>• Explanation will refer to geology where horizontal bands of hard and soft rock are crossed by the river as it flows down the long profile. The hard rock is on top – the cap rock. This leads to differential erosion as the underlying soft rock is eroded faster than the overlying hard rock via abrasion and hydraulic action. Over time, the soft rock is gouged out to leave an overhang as the profile is steepened. This will be unable to support its weight and will collapse into the plunge pool providing further material for erosion and the deepening of the waterfall. Over many centuries, the waterfall may retreat to form a gorge of recession.</li> </ul> <p>AO1 = 2 marks, AO2 = 2 marks, AO3 = 2 marks</p>																				

**Question 5 Glacial landscapes in the UK**

05	1	<p>One mark for the correct answer:  <b>A</b> glacial trough.          No credit if two or more answers shaded.          AO4 = 1 mark</p>	1
----	---	---	---

5	2	<p>One mark for the correct answer:  <b>C</b> 6252.          No credit if two or more answers shaded.          AO4 = 1 marks</p>	1
---	---	--	---

05	3	<p>One mark for the correct answer:          Glaslyn.          AO4 = 1 mark</p>	1
----	---	---	---

05	4	<p>The answer requires application of knowledge and understanding to interpret photographic evidence.</p> <p>Credit two separate points or a single developed reason, eg</p> <ul style="list-style-type: none"> <li>• rocks may be broken by frost shattering (1)</li> <li>• the rocks are well jointed, so may break up along lines of weakness as people walk on them (1)</li> <li>• water penetrates cracks during the day, then freezes and expands at night. This freeze-thaw process is repeated many times, causing the rocks to fracture (2).</li> </ul> <p>AO3 = 2 marks</p>	2
----	---	---	---

05	5	4												
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Level</th> <th style="width: 15%;">Marks</th> <th style="width: 70%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">2 (Clear)</td> <td style="text-align: center;">3–4</td> <td>                     AO2 Shows sound geographical understanding of the interrelationships between places, physical environments and processes in the context of upland glaciated areas.                       AO3 Applies knowledge and understanding of the pressures of tourism in glacial environments by interpreting photographic evidence.                 </td> </tr> <tr> <td style="text-align: center;">1 (Basic)</td> <td style="text-align: center;">1–2</td> <td>                     AO1 Demonstrates knowledge of glacial environments and recreational/tourist pressures. AO3 Applies knowledge and understanding of the pressures of tourism in glacial environments by interpreting photographic evidence.	1 (Basic)	1–2	AO1 Demonstrates knowledge of glacial environments and recreational/tourist pressures.  AO2 Shows some geographical understanding of the interrelationships between places, glacial environments and processes.		0	No relevant content.
Level	Marks	Description												
2 (Clear)	3–4	AO2 Shows sound geographical understanding of the interrelationships between places, physical environments and processes in the context of upland glaciated areas.  AO3 Applies knowledge and understanding of the pressures of tourism in glacial environments by interpreting photographic evidence.												
1 (Basic)	1–2	AO1 Demonstrates knowledge of glacial environments and recreational/tourist pressures.  AO2 Shows some geographical understanding of the interrelationships between places, glacial environments and processes.												
	0	No relevant content.												
<p><u>Indicative content</u></p> <ul style="list-style-type: none"> <li>• The focus is on pressures on the physical environment, with no credit for effects on the economy or local community. Command word is ‘suggest’, so any reasonable effects in the environment shown may be credited. Answers should make specific use of the photographs with developed explanation of the environmental effects of tourism.</li> <li>• Expect reference to footpath erosion, air and water pollution, and visual intrusiveness as might be implied in the photographs. Credit other environmental factors such as noise pollution and effects on farmland.</li> <li>• Congestion and air pollution from cars is likely to be an issue, caused by the huge number of people who visit in the summer.</li> <li>• People may park on grass verges in desperation, narrowing the road and making congestion even worse.</li> <li>• Too much recreational activity may damage fragile environments – footpath erosion causes the soil to become eroded and be washed away, which can interfere with flora and fauna.</li> <li>• The noise from water sports such as jet skis can disturb fishing. These may also leak oil and fuel, causing harm to aquatic life and polluting the water for other users.</li> </ul> <p>AO1 = 1 mark, AO2 = 2 marks, AO3 = 1 mark</p>														

05	6	6
<b>Level</b>	<b>Marks</b>	<b>Description</b>
3 (Detailed)	5–6	<p>AO3 Demonstrates thorough application of knowledge and understanding to analyse geographical information, giving detailed explanation of formation of the features shown</p> <p>AO3 Makes full analysis of the resource, using evidence to support response.</p>
2 (Clear)	3–4	<p>AO1 Demonstrates specific and accurate knowledge of processes taking place and the resultant landforms in glacial environments.</p> <p>AO2 Shows sound geographical understanding of the interrelationships between environments and processes.</p>
1 (Basic)	1–2	<p>AO1 Demonstrates some knowledge of processes operating and the resultant landforms in glacial environments.</p> <p>AO2 Shows limited geographical understanding of the interrelationships between environments and processes.</p>
	0	No relevant content.
<p><u>Indicative content</u></p> <ul style="list-style-type: none"> <li>• Responses should analyse the diagram, finding connections and providing a logical chain of reasoning.</li> <li>• Credit reference to different types of moraine, but allow explanation of other landforms of deposition. The specification includes drumlins and erratics, but credit other landforms such as till plain or outwash plain. Emphasis is on explanation, so processes should be outlined as well as the sequence of formation in relation to the chosen landforms.</li> <li>• Processes include freeze-thaw on mountain slopes, various forms of mass movement, and erosional processes of plucking and abrasion, all of which contribute to the creation of morainic debris. Transport processes are relevant as are processes of deposition under the ice (subglacial), on top of the ice (supraglacial), alongside the glacier and ahead of the glacier snout (proglacial). The focus is on different landforms, so explanation of two is sufficient to reach the top of Level 2.</li> <li>• Lateral moraine forms along the edges of the glacier. Material from the valley walls is broken up by frost shattering and falls onto the ice surface. It is then carried along the sides of the glacier. When the ice melts it forms a ridge of material along the valley side. Medial moraine is formed from two lateral moraines. When two glaciers merge, the two edges that meet form the centre line of the new glacier. As a result two lateral moraines join in the middle of the glacier forming a line of material on the glacier surface. The existence of a medial</li> </ul>		

		<p>moraine is evidence that the glacier has more than one source. When the ice melts it forms a ridge of material along the valley centre. Terminal moraine forms at the snout of the glacier. It marks the furthest extent of the ice, and forms across the valley floor. The ice scratches and scrapes the bed by a process of abrasion, generating large amounts of fine material added to by larger blocks plucked from the bed. This material is transported to the glacier snout where it is dumped in huge mounds across the valley. It is usually the feature that marks the end of unsorted deposits and the start of water sorted material.</p> <ul style="list-style-type: none"> <li>• Credit the formation of other relevant landforms such as till plains (behind the moraines) and outwash plains (in front of the moraines). Glacial till is the sediment moved directly by the ice. This material is unsorted. Glacial outwash is the sediment deposited (or redeposited) by melt-water from the glacier. Drumlins are formed by glacial ice acting on underlying unconsolidated till or ground moraine.</li> </ul> <p>No credit for only describing the features, location or position of moraines and other landforms of deposition.</p> <p>AO1 = 2 marks, AO2 = 2 marks, AO3 = 2 marks</p>
