## **GCSE Physics (8463)**

**FOR USE IN JUNE 2024 ONLY**

**[Turn over]**

**HT = Higher Tier only equations**

kinetic energy = $0.5 \times \text{mass} \times (\text{speed})^2$	$E_k = \frac{1}{2} m v^2$
elastic potential energy = $0.5 \times \text{spring constant} \times (\text{extension})^2$	$E_e = \frac{1}{2} k e^2$
gravitational potential energy = mass $\times$ gravitational field strength $\times$ height	$E_p = m g h$
change in thermal energy = mass $\times$ specific heat capacity $\times$ temperature change	$\Delta E = m c \Delta \theta$
power = $\frac{\text{energy transferred}}{\text{time}}$	$P = \frac{E}{t}$
power = $\frac{\text{work done}}{\text{time}}$	$P = \frac{W}{t}$
efficiency = $\frac{\text{useful output energy transfer}}{\text{total input energy transfer}}$	

<b>efficiency = <math>\frac{\text{useful power output}}{\text{total power input}}</math></b>	
<b>charge flow = current <math>\times</math> time</b>	<b><math>Q = I t</math></b>
<b>potential difference = current <math>\times</math> resistance</b>	<b><math>V = I R</math></b>
<b>power = potential difference <math>\times</math> current</b>	<b><math>P = V I</math></b>
<b>power = (current)<sup>2</sup> <math>\times</math> resistance</b>	<b><math>P = I^2 R</math></b>
<b>energy transferred = power <math>\times</math> time</b>	<b><math>E = P t</math></b>
<b>energy transferred = charge flow <math>\times</math> potential difference</b>	<b><math>E = Q V</math></b>
<b>density = <math>\frac{\text{mass}}{\text{volume}}</math></b>	<b><math>\rho = \frac{m}{V}</math></b>
<b>thermal energy for a change of state = mass <math>\times</math> specific latent heat</b>	<b><math>E = m L</math></b>

[Turn over]

For gases: pressure × volume = constant	$p V = \text{constant}$
weight = mass × gravitational field strength	$W = m g$
work done = force × distance (along the line of action of the force)	$W = F s$
force = spring constant × extension	$F = k e$
moment of a force = force × distance (normal to direction of force)	$M = F d$
pressure = $\frac{\text{force normal to a surface}}{\text{area of that surface}}$	$p = \frac{F}{A}$
pressure due to a column of liquid = height of column × density of liquid × gravitational field strength	$p = h \rho g$
distance travelled = speed × time	$s = v t$
acceleration = $\frac{\text{change in velocity}}{\text{time taken}}$	$a = \frac{\Delta v}{t}$

	$v^2 - u^2 = 2 a s$
	$F = m a$
HT	$p = m v$
	$F = \frac{m \Delta v}{\Delta t}$
HT	$T = \frac{1}{f}$
	$v = f \lambda$
HT	$F = B I l$

[Turn over]

<p>HT</p> <p><b><math>\frac{\text{potential difference across primary coil}}{\text{potential difference across secondary coil}} = \frac{\text{number of turns in primary coil}}{\text{number of turns in secondary coil}}</math></b></p>	$\frac{V_p}{V_s} = \frac{n_p}{n_s}$
<p>HT</p> <p><b>potential difference across primary coil × current in primary coil = potential difference across secondary coil × current in secondary coil</b></p>	$V_p I_p = V_s I_s$
