PSYCHOLOGY
(7182/1)
Paper 1 Introductory Topics in Psychology

2017 Morning Time allowed: 2 hours

Materials
For this paper you may have:
• a calculator.

Instructions
• Use black ink or black ball-point pen.
• Fill in the boxes at the bottom of this page.
• Answer all questions. You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
• Do all rough work in this book. Cross through any work you do not want to be marked.

Information
• The marks for questions are shown in brackets.
• The maximum mark for this paper is 96.
• Questions should be answered in continuous prose. You will be assessed on your ability to:
  - use good English
  - organise information clearly
  - use specialist vocabulary where appropriate.

Please write clearly, in block capitals, to allow character computer recognition.

Briefly outline and evaluate the findings of any one study of social influence. [4 marks]

Section A continues on the next page
Two psychology students were discussing the topic of social influence.

‘I find it fascinating how some people are able to resist social influence’, said Jack. ‘It must be the result of having a confident personality.’

‘I disagree’, replied Sarah. ‘I think resisting social influence depends much more on the presence of others.’

Discuss two explanations of resistance to social influence. As part of your discussion, refer to the views expressed by Jack and Sarah in the conversation above.

You may use this space to plan your answer.
An experiment was carried out to test the effects of learning similar and dissimilar information on participants' ability to remember.

In **Stage 1** of the experiment, 10 participants in **Group A**, the ‘similar’ condition, were given a list of 20 place names in the UK. They were given two minutes to learn the list. 10 different participants in **Group B**, the ‘dissimilar’ condition, were given the same list of 20 place names in the UK. They were also given two minutes to learn the list.

In **Stage 2** of the experiment, participants in **Group A** were given a different list of 20 more place names in the UK, and were given a further two minutes to learn it. Participants in **Group B** were given a list of 20 boys' names, and were given a further two minutes to learn it.

In **Stage 3** of the experiment, all participants were given five minutes to recall as many of the 20 place names in the UK, from the list in **Stage 1**, as they could. The raw data from the two groups is below.

**Table 1: Number of place names recalled from the list in Stage 1**

What is the most appropriate measure of central tendency for calculating the average of the scores, from Table 1, in each of the two groups? Justify your answer.

[2 marks]

Calculate the measure of central tendency you have identified in your answer to question 04.1 for Group A and Group B. Show your calculations for each group.

[4 marks]

In Stage 3 of the experiment, several participants in Group A, the ‘similar’ condition, recalled words from the Stage 2 list rather than the Stage 1 list.

Use your knowledge of forgetting to explain why this may have occurred.

[2 marks]
Describe and evaluate the working memory model of memory.

You may use this space to plan your answer.

Answer all questions in this section

**Name three stages in the development of attachments identified by Schaffer.**

1

2

3

**[3 marks]**

**Read the item and then answer the question that follows.**

A nursery school worker and her manager were chatting at the end of the day.

‘How did the new toddlers settle in today?’ asked the manager.

‘They behaved very differently’, replied the nursery school worker. ‘Max was distressed when his mother left but was happy to see her at the end of the day.’

‘Jessica arrived clinging to her mother and I could not calm her down when her mother left.’

‘William barely seemed to notice when his mother left and did not even look up when she returned to collect him.’

**Name the attachment type demonstrated by each of the children in the conversation above by writing the attachment type next to the name below.**

**[3 marks]**

Max

Jessica

William
Briefly evaluate learning theory as an explanation of attachment. [4 marks]

Read the item and then answer the question that follows.

A group of researchers used ‘event sampling’ to observe children’s friendships over a period of three weeks at break times and lunchtimes during the school day.

Explain what is meant by ‘event sampling’. [2 marks]

Section C continues on the next page
The investigation in question 09 is an example of a 'naturalistic observation'.

Briefly discuss how observational research might be improved by conducting observations in a controlled environment.

[4 marks]

Discuss research into the influence of early attachment on adult relationships.

[8 marks]

Which two of the following are examples of Jahoda’s criteria for ‘ideal mental health’? Shade two boxes only. For each answer completely fill in the circle alongside the appropriate answer.

A. Dependence on others
B. Environmental mastery
C. Lack of inhibition
D. Maladaptiveness
E. Resistance to stress

[2 marks]

Read the item and then answer the question that follows.

The following article appeared in a magazine:

**Hoarding disorder – A ‘new’ mental illness**

Most of us are able to throw away the things we don’t need on a daily basis. Approximately 1 in 1000 people, however, suffer from hoarding disorder, defined as ‘a difficulty parting with items and possessions, which leads to severe anxiety and extreme clutter that affects living or work spaces’.

Apart from ‘deviation from ideal mental health’, outline three definitions of abnormality. Refer to the article above in your answer.

[6 marks]
Kirsty is in her twenties and has had a phobia of balloons since one burst near her face when she was a little girl. Loud noises such as ‘banging’ and ‘popping’ cause Kirsty extreme anxiety, and she avoids situations such as birthday parties and weddings, where there might be balloons.

Suggest how the behavioural approach might be used to explain Kirsty’s phobia of balloons.

[4 marks]
Twenty depressed patients were treated using cognitive behavioural therapy. Over the course of the six-week treatment, each patient’s mood was monitored every week using a self-report mood scale (where a score of 20 = extremely positive mood and a score of 0 = extremely negative mood). Each week they also completed a quality of sleep questionnaire which was scored from 10 = excellent sleep to 0 = very poor sleep.

At the end of the study the researchers correlated each patient’s final mood score with his or her final sleep score. The results are shown in Figure 1 below.

**Figure 1:** Scattergram to show the relationship between final mood scores and final sleep scores for 20 patients at the end of therapy

Outline the type of relationship shown in Figure 1 above and suggest why it would not be appropriate for the researchers to conclude that better sleep improves mood.  

[2 marks]
15.2 Outline one way in which the researchers should have dealt with ethical issues in this study. [2 marks]

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

15.3 The sleep questionnaire used by the researchers had not been checked to see whether or not it was a reliable measure of sleep quality.

Explain how this study could be modified by checking the sleep questionnaire for test-retest reliability. [4 marks]
