## HT = Higher Tier only equations

|  |  |
|--|--|
| <b>kinetic energy = 0.5 × mass × (speed)<sup>2</sup></b>                                     | <b><math>E_k = \frac{1}{2} m v^2</math></b>      |
| <b>elastic potential energy =<br/>0.5 × spring constant × (extension)<sup>2</sup></b>        | <b><math>E_e = \frac{1}{2} k e^2</math></b>      |
| <b>gravitational potential energy =<br/>mass × gravitational field strength ×<br/>height</b> | <b><math>E_p = m g h</math></b>                  |
| <b>change in thermal energy =<br/>mass × specific heat capacity ×<br/>temperature change</b> | <b><math>\Delta E = m c \Delta \theta</math></b> |
| <b>power = <math>\frac{\text{energy transferred}}{\text{time}}</math></b>                    | <b><math>P = \frac{E}{t}</math></b>              |

|  |                                     |
|--|-------------------------------------|
| <b>power = <math>\frac{\text{work done}}{\text{time}}</math></b>   | <b><math>P = \frac{W}{t}</math></b> |
| <b>efficiency = <math>\frac{\text{useful output energy transfer}}{\text{total input energy transfer}}</math></b> |                                     |
| <b>efficiency = <math>\frac{\text{useful power output}}{\text{total power input}}</math></b>                     |                                     |
| <b>charge flow = current × time</b>  | <b><math>Q = I t</math></b>         |
| <b>potential difference = current × resistance</b>   | <b><math>V = I R</math></b>         |
| <b>power = potential difference × current</b>  | <b><math>P = V I</math></b>         |

|  |  |
|--|--|
| <b>power = (current)<sup>2</sup> × resistance</b>  | <b><math>P = I^2 R</math></b>          |
| <b>energy transferred = power × time</b>   | <b><math>E = P t</math></b>            |
| <b>energy transferred = charge flow × potential difference</b>   | <b><math>E = Q V</math></b>            |
| <b>potential difference across primary coil × current in primary coil = potential difference across secondary coil × current in secondary coil</b> | <b><math>V_p I_p = V_s I_s</math></b>  |
| <b>density = <math>\frac{\text{mass}}{\text{volume}}</math></b>  | <b><math>\rho = \frac{m}{V}</math></b> |
| <b>thermal energy for a change of state = mass × specific latent heat</b>  | <b><math>E = m L</math></b>            |
| <b>weight = mass × gravitational field strength</b>  | <b><math>W = m g</math></b>            |

HT

|  |                          |
|--|--------------------------|
| <b>work done = force × distance (along the line of action of the force)</b>                        | $W = F s$                |
| <b>force = spring constant × extension</b>   | $F = k e$                |
| <b>distance travelled = speed × time</b>   | $s = v t$                |
| <b>acceleration = <math>\frac{\text{change in velocity}}{\text{time taken}}</math></b>             | $a = \frac{\Delta v}{t}$ |
| <b>(final velocity)<sup>2</sup> – (initial velocity)<sup>2</sup> = 2 × acceleration × distance</b> | $v^2 - u^2 = 2 a s$      |
| <b>resultant force = mass × acceleration</b>   | $F = m a$                |
| <b>HT momentum = mass × velocity</b>   | $p = m v$                |

HT

[Turn over]

|   |                   |
|---|-------------------|
| $\text{period} = \frac{1}{\text{frequency}}$  | $T = \frac{1}{f}$ |
| <b>wave speed = frequency × wavelength</b>  | $v = f \lambda$   |
| <b>force on a conductor (at right angles to a magnetic field) carrying a current = magnetic flux density × current × length</b> | $F = B I l$       |
