BIOLOGY

Paper 1

7402/1

Monday 12 June 2017    Afternoon

Time allowed: 2 hours

For this paper you must have:
- a ruler with millimetre measurements
- a calculator.

At the top of the page, write your surname and other names, your centre number, your candidate number and add your signature.

[Turn over]
INSTRUCTIONS
• Use black ink or black ball-point pen.
• Answer ALL questions.
• You must answer the questions in the spaces provided. Do not write on blank pages.
• All work must be shown.
• Do all rough work in this book. Cross through any work you do not want to be marked.

INFORMATION
• The marks for questions are shown in brackets.
• The maximum mark for this paper is 91.

DO NOT TURN OVER UNTIL TOLD TO DO SO
Answer ALL questions in the spaces provided.

0.1. 1

Give the TWO types of molecule from which a ribosome is made. [1 mark]

_________________________________________________
_________________________________________________
_________________________________________________

0.1. 2

Describe the role of a ribosome in the production of a polypeptide. Do NOT include transcription in your answer. [3 marks]

_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________

_________________________________________________________________

_________________________________________________________________

_________________________________________________________________
In mammals, in the early stages of pregnancy, a developing embryo exchanges substances with its mother via cells in the lining of the uterus. At this stage, there is a high concentration of glycogen in cells lining the uterus.

Describe the structure of glycogen. [2 marks]
During early pregnancy, the glycogen in the cells lining the uterus is an important energy source for the embryo.

Suggest how glycogen acts as a source of energy.

Do NOT include transport across membranes in your answer. [2 marks]
Suggest and explain TWO ways the cell-surface membranes of the cells lining the uterus may be adapted to allow rapid transport of nutrients. [2 marks]

1. ____________________________________________________________
   ____________________________________________________________
   ____________________________________________________________
   ____________________________________________________________

2. ____________________________________________________________
   ____________________________________________________________
   ____________________________________________________________
   ____________________________________________________________

[Turn over]
In humans, after the gametes join at fertilisation, every cell of the developing embryo undergoes mitotic divisions before the embryo attaches to the uterus lining.

- The first cell division takes 24 hours.
- The subsequent divisions each take 8 hours.

After 3 days, the embryo has a total volume of $4.2 \times 10^{-3} \text{ mm}^3$.

What is the mean volume of each cell after 3 days? Express your answer in standard form.

Show your working. [2 marks]
Answer = ______________________________ mm$^3$

[Turn over]
Sodium ions from salt (sodium chloride) are absorbed by cells lining the gut. Some of these cells have membranes with a carrier protein called NHE3.

NHE3 actively transports one sodium ion into the cell in exchange for one proton (hydrogen ion) out of the cell.

Use your knowledge of transport across cell membranes to suggest how NHE3 does this. [3 marks]
BLANK PAGE

[Turn over]
Scientists investigated the use of a drug called Tenapanor to reduce salt absorption in the gut. Tenapanor inhibits the carrier protein, NHE3.

The scientists fed a diet containing a high concentration of salt to two groups of rats, A and B.

- The rats in Group A were not given Tenapanor (0 mg kg⁻¹).
- The rats in Group B were given 3 mg kg⁻¹ Tenapanor.

One hour after treatment, the scientists removed the gut contents of the rats and immediately weighed them.

Their results are shown in TABLE 2.

**TABLE 2**

<table>
<thead>
<tr>
<th>Concentration of Tenapanor / mg kg⁻¹</th>
<th>Mean mass of contents of the gut / g</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>2.0</td>
</tr>
<tr>
<td>3</td>
<td>4.1</td>
</tr>
</tbody>
</table>

The scientists carried out a statistical test to see whether the difference in the means was significant. They calculated a P value of less than 0.05.

They concluded that Tenapanor did reduce salt absorption in the gut.
Use all the information provided and your knowledge of water potential to explain how they reached this conclusion. [4 marks]
High absorption of salt from the diet can result in a higher than normal concentration of salt in the blood plasma entering capillaries. This can lead to a build-up of tissue fluid.

Explain how. [2 marks]
Bacteria are often used in industry as a source of enzymes. One reason is because bacteria divide rapidly, producing a large number of them in a short time.

Describe how bacteria divide. [2 marks]

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

[Turn over]
Washing powders often contain enzymes from bacteria. These enzymes include proteases that hydrolyse proteins in clothing stains.

FIGURE 1 shows the effect of temperature on a protease that could be used in washing powder.
Explain the shape of the curves at 50 °C and 60 °C. [4 marks]
Some proteases are secreted as extracellular enzymes by bacteria.

Suggest ONE advantage to a bacterium of secreting an extracellular protease in its natural environment.

Explain your answer. [2 marks]

_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________
_________________________________________________
Mammals have some cells that produce extracellular proteases. They also have cells with membrane-bound dipeptidases.

Describe the action of these membrane-bound dipeptidases and explain their importance. [2 marks]

[Turn over]
Scientists investigated treatment of a human bladder infection caused by a species of bacterium. This species of bacterium is often resistant to the antibiotics currently used for treatment.

They investigated the use of a new antibiotic to treat the bladder infection. The new antibiotic inhibits the bacterial ATP synthase enzyme.

Place a tick (✔) in the appropriate box next to the equation which represents the reaction catalysed by ATP synthase. [1 mark]

- ATP → ADP + P_i + H_2O
- ATP + H_2O → ADP + P_i
- ADP + P_i → ATP + H_2O
- ADP + P_i + H_2O → ATP
The new antibiotic is safe to use in humans because it does NOT inhibit the ATP synthase found in human cells.

Suggest why human ATP synthase is not inhibited and bacterial synthase is inhibited. [1 mark]

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

[Turn over]
The scientists tested the new antibiotic on mice with the same bladder infection. They divided these mice into three groups, C, R and A.

- Group C was the control (untreated).
- Group R was treated with an antibiotic currently used against this bladder infection.
- Group A was treated with the new antibiotic.

They removed samples from the bladder of these mice after treatment and estimated the total number of bacteria in the bladder.

Their results are shown in FIGURE 2.
FIGURE 2

Log\textsubscript{10} number of bacteria in bladder

Group C

Group R

Group A
The antibiotics were given to the mice at a dose of 25 mg kg\(^{-1}\) per day.

Calculate how much antibiotic would be given to a 30 g mouse each day.

Show your working. [2 marks]

Answer = ___________________________ mg
Calculate the percentage difference in actual numbers of bacteria in group A compared with group R. The actual number of bacteria can be calculated from the log_{10} value by using the 10^x function on a calculator.

Show your working. [2 marks]

Answer = ______________________________________ %
The scientists suggested that people newly diagnosed with this bladder infection should be treated with both the current antibiotic and the new antibiotic.

Explain why the scientists made this suggestion.

Use information from FIGURE 2, on page 27, and your knowledge of evolution of antibiotic resistance in bacteria in your answer. [3 marks]
2,4-D is a selective herbicide that kills some species of plants but not others. 2,4-D disrupts cell-surface membranes but the extent of disruption differs in different species.

Scientists investigated the effect of 2,4-D on wheat plants (a crop) and on wild oat plants (a weed).

They grew plants of both species in glasshouses. They put plants of each species into one of two groups, W and H, which were treated as follows:

- Group W – leaves sprayed with water
- Group H – leaves sprayed with a solution of 2,4-D.

After spraying, they cut 40 discs from the leaves of plants in each group and placed them in flasks containing 10 cm³ de-ionised water. After 5 minutes, they calculated the disruption to cell-surface membranes by measuring the concentration of ions released into the water from the leaf discs.

Their results are shown in TABLE 3.

The lowest significant difference (LSD), is the smallest difference between two means that would be significant at $P \leq 0.05$.

Evaluate the use of 2,4-D as a herbicide on a wheat crop that contains wild oats as a weed. Use all the information provided. [4 marks]

---

06.2
The scientists incubated the flasks containing the leaf discs at 26 °C and gently shook the flasks.

Suggest ONE reason why the scientists ensured the temperature remained constant and ONE reason why the leaf discs were shaken. [2 marks]

Temperature

Shaken

[Turn over]
Describe how phagocytosis of a virus leads to presentation of its antigens. [3 marks]
Describe how presentation of a virus antigen leads to the secretion of an antibody against this virus antigen. [3 marks]
Collagen is a protein produced by cells in joints, such as the knee.

Rheumatoid arthritis (RA) is an auto-immune disease. In an auto-immune disease, a person’s immune system attacks their own cells. RA causes pain, swelling and stiffness in the joints.

Scientists have found a virus that produces a protein very similar to human collagen.

Suggest how the immune response to this viral protein can result in the development of RA. [2 marks]
