Answer all questions in the spaces provided.

01

01.1 Shade in one lozenge to indicate which of the symbols represents the set of rational numbers.

[1 mark]

Q ○ R ○ Z ○ N ○

01.2 Shade in one lozenge to indicate which of the symbols represents the set of numbers that does not include all of the numbers -3, 4 and 9.

[1 mark]

Q ○ R ○ Z ○ N ○

01.3 Shade in one lozenge to indicate which of the symbols represents the set of numbers that is most suitable for measuring the circumference of a ball.

[1 mark]

Q ○ R ○ Z ○ N ○

**0 2** Figure 1a and Figure 1b show two bit patterns.

**Figure 1a**

```
0 0 0 1 0 1 1 1
```

**Figure 1b**

```
0 0 0 0 0 1 1 0
```

**0 2 · 1** Explain how unsigned binary integers can be converted to hexadecimal.

You should illustrate in your explanation how the bit pattern in **Figure 1a** would be converted.

[2 marks]

**0 2 · 2** If **Figure 1a** and **Figure 1b** both represent unsigned binary integers, what is the binary result of adding the two numbers together?

[1 mark]

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

Answer: ____________________________
If Figure 1a and Figure 1b both represent unsigned binary integers, what is the binary result of multiplying the two numbers?

You must show your working.

Answer: ____________________________

Figure 2

Indicate clearly on Figure 2 where the binary point must be placed so that the value 19.375 is represented.

Figure 3 is a 7-bit ASCII character to be transmitted across a network. The system uses odd parity with the parity bit being transmitted in the MSB (Most Significant Bit).

Calculate the parity bit and write it in the empty cell in Figure 3.
When transmitting data across a network some systems use majority voting rather than a parity bit.

State **one** advantage of using majority voting over a parity bit and explain how this advantage is achieved.  

[2 marks]

A band is recording and digitising a song to make available as a download from their website.

The song lasts 3 minutes. The sample resolution is 16 bits and a sample rate of 44 kHz has been used.

A sample rate of 1 Hz means that one sample has been taken every second.

Calculate the minimum amount of storage space, in megabytes (MB), needed to store the song in an uncompressed format.

You **must** show your working.  

[3 marks]

Answer: _________________________
The song is being recorded using a microphone plugged into the sound card of the computer. The sound card contains an analogue to digital converter (ADC).

Describe the steps the ADC goes through in this process. [3 marks]

The band have been advised to save their song using lossless compression.

Explain why it might be appropriate for the band to save the song using lossless compression rather than using lossy compression. [2 marks]
Explain the differences between an interpreter and a compiler. [4 marks]

A company is using a newly-developed processor in its latest microwave oven. A software developer is writing the program to control the oven.

The developer chose to use **assembly language** rather than a high-level language to write the program.

Explain why the developer may have made this decision.

The two most common computer architectures are Harvard and von Neumann.

Describe one difference between the way the Harvard and von Neumann architectures operate.

[2 marks]

Shade one lozenge to indicate the type of computer architecture that is typically used for digital signal processing.

[1 mark]

Harvard  von Neumann
Describe, using full sentences, the steps involved in the Fetch-Execute cycle for the von Neumann architecture. Your description should cover the fetch, decode and execute stages and must clearly state which of the three sections each step falls in.

[6 marks]
Table 1 – standard AQA assembly language instruction set. This should be used to answer question parts 07.1 and 07.2

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDR Rd, &lt;memory ref&gt;</td>
<td>Load the value stored in the memory location specified by &lt;memory ref&gt; into register d.</td>
</tr>
<tr>
<td>STR Rd, &lt;memory ref&gt;</td>
<td>Store the value that is in register d into the memory location specified by &lt;memory ref&gt;.</td>
</tr>
<tr>
<td>ADD Rd, Rn, &lt;operand2&gt;</td>
<td>Add the value specified in &lt;operand2&gt; to the value in register n and store the result in register d.</td>
</tr>
<tr>
<td>SUB Rd, Rn, &lt;operand2&gt;</td>
<td>Subtract the value specified by &lt;operand2&gt; from the value in register n and store the result in register d.</td>
</tr>
<tr>
<td>MOV Rd, &lt;operand2&gt;</td>
<td>Copy the value specified by &lt;operand2&gt; into register d.</td>
</tr>
<tr>
<td>CMP Rn, &lt;operand2&gt;</td>
<td>Compare the value stored in register n with the value specified by &lt;operand2&gt;.</td>
</tr>
<tr>
<td>B &lt;label&gt;</td>
<td>Always branch to the instruction at position &lt;label&gt; in the program.</td>
</tr>
<tr>
<td>B&lt;condition&gt; &lt;label&gt;</td>
<td>Branch to the instruction at position &lt;label&gt; if the last comparison met the criterion specified by &lt;condition&gt;. Possible values for &lt;condition&gt; and their meanings are: EQ: equal to NE: not equal to GT: greater than LT: less than</td>
</tr>
<tr>
<td>AND Rd, Rn, &lt;operand2&gt;</td>
<td>Perform a bitwise logical AND operation between the value in register n and the value specified by &lt;operand2&gt; and store the result in register d.</td>
</tr>
<tr>
<td>ORR Rd, Rn, &lt;operand2&gt;</td>
<td>Perform a bitwise logical OR operation between the value in register n and the value specified by &lt;operand2&gt; and store the result in register d.</td>
</tr>
<tr>
<td>EOR Rd, Rn, &lt;operand2&gt;</td>
<td>Perform a bitwise logical XOR (exclusive or) operation between the value in register n and the value specified by &lt;operand2&gt; and store the result in register d.</td>
</tr>
<tr>
<td>MVN Rd, &lt;operand2&gt;</td>
<td>Perform a bitwise logical NOT operation on the value specified by &lt;operand2&gt; and store the result in register d.</td>
</tr>
<tr>
<td>LSL Rd, Rn, &lt;operand2&gt;</td>
<td>Logically shift left the value stored in register n by the number of bits specified by &lt;operand2&gt; and store the result in register d.</td>
</tr>
<tr>
<td>LSR Rd, Rn, &lt;operand2&gt;</td>
<td>Logically shift right the value stored in register n by the number of bits specified by &lt;operand2&gt; and store the result in register d.</td>
</tr>
<tr>
<td>HALT</td>
<td>Stops the execution of the program.</td>
</tr>
</tbody>
</table>

Labels: A label is placed in the code by writing an identifier followed by a colon (:). To refer to a label the identifier of the label is placed after the branch instruction.

Interpretation of <operand2>

<operand2> can be interpreted in two different ways, depending on whether the first character is a # or an R:
- # – use the decimal value specified after the #, eg #25 means use the decimal value 25.
- Rm – use the value stored in register m, eg R6 means use the value stored in register 6.

The available general purpose registers that the programmer can use are numbered 0 to 12.
Figure 5 shows an incomplete assembly language program. The intended purpose of the code is to count from 1 to 10 inclusive, writing the values to memory location 17, which is used to control a motor.

Complete the code in Figure 5. You may not need to use all four lines for your solution and you should not write more than one instruction per line.

[4 marks]

Figure 5

MOV R0, #1
startloop:
    STR R0, 17
    ______________________
    ______________________
    ______________________
    ______________________
endloop:
    HALT

R1 contains the decimal value 7. What value will be contained in R1 after the instruction below is executed?

[1 mark]

[1 mark]

Explain the difference between direct addressing and immediate addressing.

[1 mark]
Devices can communicate using either parallel or serial transmission.

Parallel transmission sends many bits at the same time whilst serial transmission only sends one bit at a time.

Describe two reasons why serial transmission might be preferred to parallel transmission.

[4 marks]

In the context of networking, define the following terms.

[2 marks]

Bit rate: _____________________________

Latency: _____________________________
0 8 . 3 Explain how disabling SSID (Service Set Identifier) broadcasting can increase the security of a wireless network. [2 marks]

0 8 . 4 Explain how the use of a MAC (Media Access Control) address white list can increase the security of a wireless network. [2 marks]
Google have a service called Street View which allows a user to view surroundings from street-level. Google have extended their Street View service to cover the inside of buildings such as museums and sports stadiums.

Discuss a range of ethical, legal and cultural issues that Google may have needed to deal with when extending the service.

[9 marks]
A laser printer has a representation of an image stored in its memory.

Describe how it prints this image on to a piece of paper. [6 marks]
