**Paper 3**

**7402/3**

**Monday 18 June 2018 Morning**

**Time allowed: 2 hours**

**At the top of the page, write your surname and other names, your centre number, your candidate number and add your signature.**

**[Turn over]**

**For this paper you must have:**

- **a ruler with millimetre measurements**
- **a scientific calculator.**

## **INSTRUCTIONS**

- **Use black ink or black ball-point pen.**
- **Answer ALL questions in SECTION A.**
- **Answer ONE question from SECTION B.**
- **You must answer the questions in the space provided. Do not write on blank pages.**
- **Show all your working.**
- **Do all rough work in this book. Cross through any work you do not want to be marked.**

## **INFORMATION**

- **The marks for the questions are shown in brackets.**
- **The maximum mark for this paper is 78.**

**DO NOT TURN OVER UNTIL TOLD TO  
DO SO**

## **SECTION A**

**Answer ALL questions in this section.**

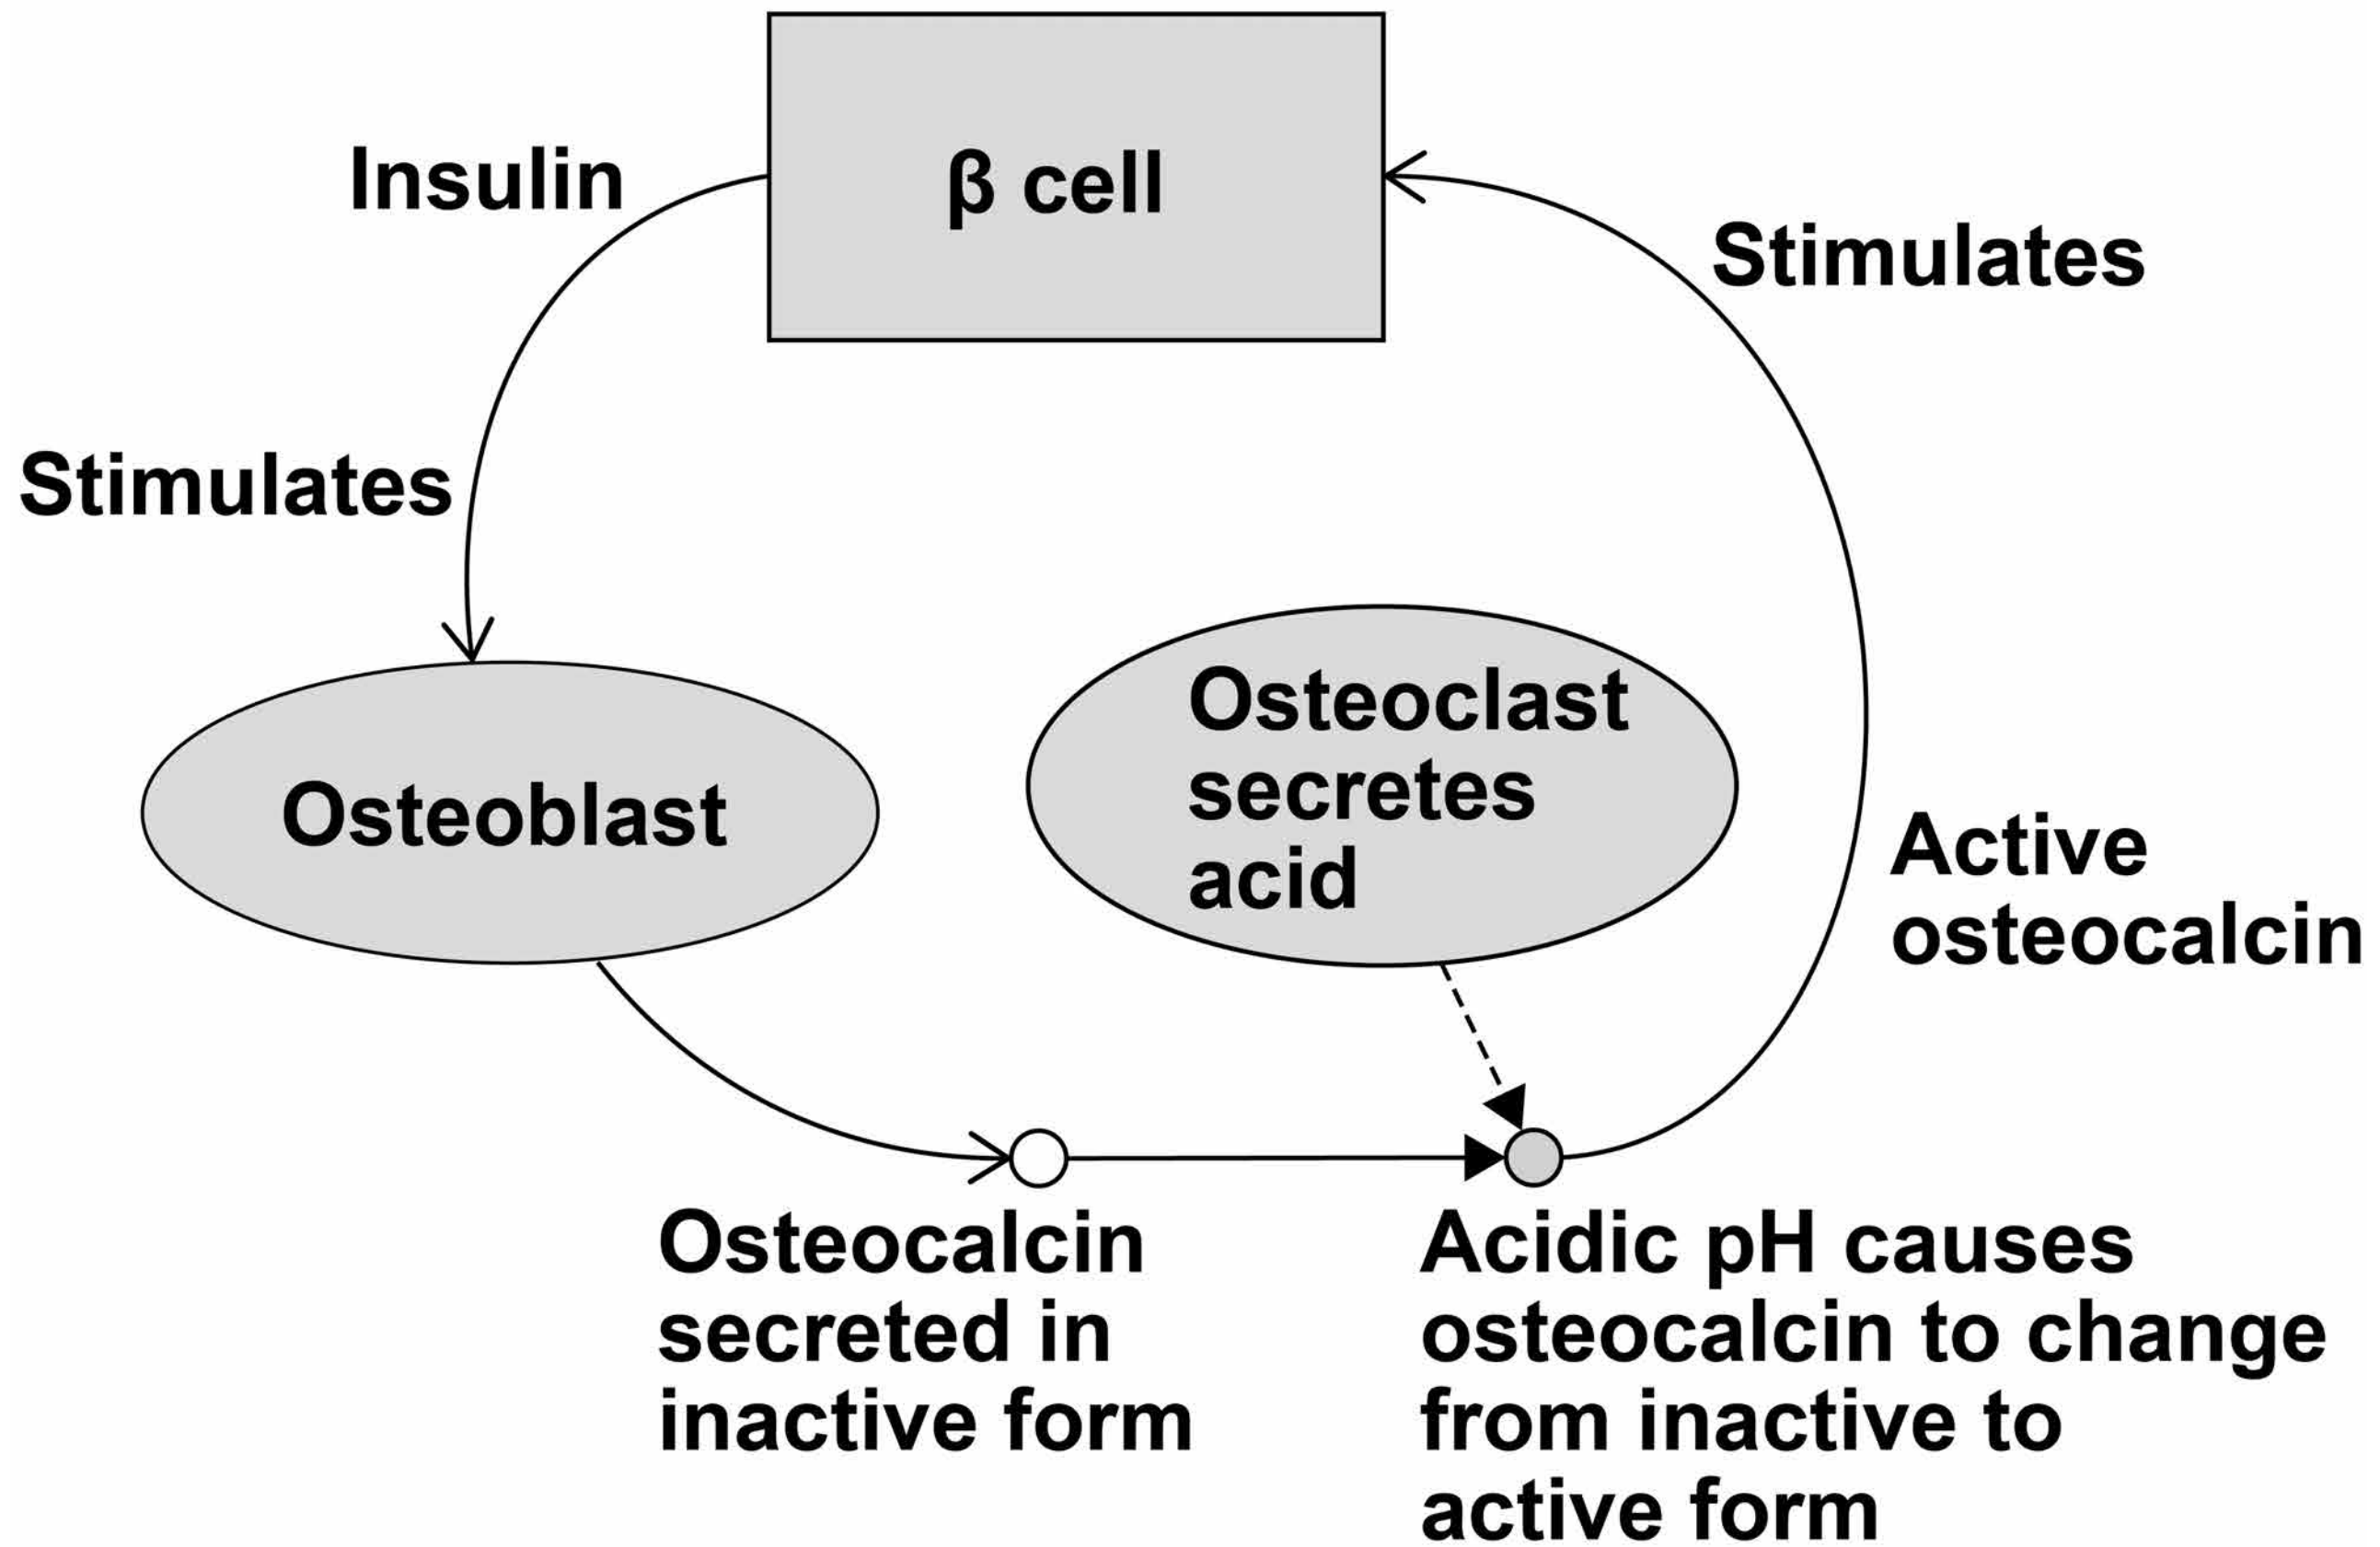

**You are advised to spend no more than one hour and 15 minutes on this section.**

**0 1** Broken bones are repaired by cells called osteoclasts and osteoblasts.

**Osteoblasts secrete a hormone called osteocalcin in an inactive form. Osteocalcin is a protein. The active form of osteocalcin binds to a receptor on beta ( $\beta$ ) cells in the pancreas, stimulating them to release insulin. Osteoblasts have receptors for insulin.**

**FIGURE 1 shows how the production of osteocalcin by osteoblasts is controlled by positive feedback.**

**FIGURE 1**

5

**[Turn over]**

**BLANK PAGE**

**01.1**

**The secretion of osteocalcin (in an inactive form) by osteoblasts is controlled by positive feedback.**

**Use information from FIGURE 1, on page 5, to explain why this is positive feedback. [2 marks]**

**Percentage  
of B cells  
destroyed by  
Rituximab**

**Amount of CD20 on surface  
of B cells of CLL  
patient / arbitrary units**

**0 2**

**Chronic lymphocytic leukaemia (CLL) is a cancer that affects some B cells of a person's immune system.**

**Rituximab is a drug used to treat CLL. It binds to a protein called CD20 on the surface of B cells. If enough Rituximab binds to a B cell, it can kill the cell. Rituximab kills BOTH healthy AND cancerous B cells. The body then produces new B cells.**

**The amount of CD20 on the surface of B cells varies from one person to another. Doctors investigated the relationship between the amount of CD20 on the B cells of a patient and the percentage of B cells destroyed by Rituximab.**

**[Turn over]**

**BLANK PAGE**

**FIGURE 2, on page 10, shows the doctors' results. Each cross is the result for one patient.**

**02.1**

**What statistical test could the scientists have used to determine whether there was a significant relationship between the amount of CD20 on the surface of B cells and the percentage of B cells destroyed by Rituximab?**

**Give a reason for your answer.**

**[1 mark]**

**BLANK PAGE**

**BLANK PAGE**

**Approximately 11 percent of people with CLL also have mutations of a gene called *NOTCH1*. This leads to production of a non-functional transcription factor associated with CD20 production.**

**The doctors determined the median percentage of B cells destroyed by Rituximab in people with CLL who had the *NOTCH1* mutation and those who did not.**

**The doctors' results are shown in TABLE 1, on page 20.**

**BLANK PAGE**

**[Turn over]**

TABLE 1

	<b>Median percentage of B cell destroyed by Rituximab</b>
<b>In people with CLL who had the <i>NOTCH1</i> mutation</b>	<b>4</b>
<b>In people with CLL who did NOT have <i>NOTCH1</i> mutation</b>	<b>22</b>

**0 2 . 3** Human blood contains  
(approximately)  
 $1.0 \times 10^9$  B cells per  $\text{dm}^3$ .

Use the median values in TABLE 1 to calculate the difference between the number of B cells per  $\text{dm}^3$  in the blood of people treated with Rituximab with the *NOTCH1* mutation and people without the *NOTCH1* mutation.

Express your answer in standard form.

Show your working. [2 marks]

\_\_\_\_\_ cells per  $\text{dm}^3$

[Turn over]

**This very small daughter cell is called a polar body. Polar bodies do not usually divide. The same process occurs in the second division of meiosis, resulting in one egg cell and two polar bodies.**

**The diagram in FIGURE 3, on page 25, shows the formation of an egg cell and two polar bodies during meiosis. It also shows what happens to one pair of homologous chromosomes. This pair carries two alleles of gene A.**

**0 3 . 1**

**Complete FIGURE 3, on page 25, by putting A or a in the boxes. One box has been completed for you with A. [1 mark]**

**FIGURE 3**

**FIGURE 3 is not drawn to scale.**

**[Turn over]**

**BLANK PAGE**

**03.2** Put a tick (✓) in the box next to the name of the process that produced the combination of alleles on the chromosome in the first polar body in **FIGURE 3**.  
[1 mark]

**Anaphase**

**Crossing over**

**Independent assortment**

**Semi-conservative replication**

**[Turn over]**

**03.3** A scientist measured the diameter of a polar body and the diameter of the nucleus inside it. The diameter of the polar body was  $10.4 \mu\text{m}$  and the diameter of the nucleus was  $7.0 \mu\text{m}$ . The density of mitochondria in the cytoplasm of the polar body (outside of the nucleus) was  $0.08$  mitochondria per  $\mu\text{m}^3$ .

**Calculate the number of mitochondria in the polar body. You should assume polar bodies and nuclei are spherical.**

**The formula for the volume of a sphere is**

$$\frac{4}{3} \pi r^3 \text{ where } \pi = 3.14$$

**Show your working. [2 marks]**

**Number of mitochondria**

**= \_\_\_\_\_**

**[Turn over]**

**03.4** Mitochondrial diseases are caused by faulty mitochondria. All of a person's mitochondria are inherited from their mother via the egg cell. An egg cell contains approximately  $3 \times 10^5$  mitochondria.

**One proposed treatment to prevent passing on faulty mitochondria involves**

- **removing the nucleus from an egg cell donated by a woman with healthy mitochondria**
- **replacing this nucleus with the contents of the polar body from a woman whose egg cells are affected by mitochondrial disease.**

**Suggest how this treatment prevents inheritance of mitochondrial diseases. [2 marks]**

**A haemocytometer is a special microscope slide which can be used to count the numbers of blood cells in a sample of blood.**

- The surface of the slide has many small, equal-sized squares marked on it.**
- The depth of the liquid under each square is 0.1 mm**
- When counting, cells that touch top or left lines are counted but cells that touch right or bottom lines are not counted.**

**A doctor used a haemocytometer to determine the number of red blood cells per  $\text{mm}^3$  in a blood sample. He diluted the original blood sample by a factor of 200 times before putting some on a haemocytometer.**

**FIGURE 4 shows the distribution of cells in a typical small square.**

**FIGURE 4**

**The depth of the liquid the red blood cells are in is 0.1 mm**

**[Turn over]**

**0 4 . 2**

**The doctor counted the red blood cells in many small squares.**

**The MEAN number of red blood cells per small square was 7**

**The original blood sample was diluted by a factor of 200 times.**

**37**

**Calculate the number of red blood cells per  $\text{mm}^3$  in the original blood sample. Give your answer in standard form. [2 marks]**

**Answer =**

**\_\_\_\_\_ red blood cells per  $\text{mm}^3$**

**[Turn over]**

**04.3**

**When counting, cells that touch top or left lines are counted but cells that touch right or bottom lines ARE NOT counted.**

The doctor also wanted to know how many white blood cells per  $\text{mm}^3$  there were in a different sample of blood. To do this he first diluted the sample by a factor of 20 times. He then made the white blood cells clearly visible by using a stain that makes nuclei appear dark blue.

**04.4** When counting white blood cells, the doctor only diluted the blood sample by a factor of 20 times, instead of 200 times when counting red blood cells.

**Suggest why he only diluted the sample by a factor of 20 times.**

**[Turn over]**

**BLANK PAGE**

**05.3** **CENP-W is involved in the formation of spindle fibres in mitosis. Spindle fibres are made of molecules of a protein called tubulin.**

**The scientists treated cells in a culture with small interfering RNA (siRNA). This siRNA causes RNA interference of expression of the *CENP-W* gene. The scientists took samples of cells at 0, 48 and 72 hours after adding the siRNA. They then used gel electrophoresis to separate CENP-W and tubulin from these samples.**

**FIGURE 5 shows the results of the electrophoresis. The size of each band is proportional to the amount of CENP-W or tubulin present.**

**FIGURE 5**

**Suggest how the siRNA produced these results.

**Ammonia in soil is oxidised to nitrites and nitrates by species of nitrifying bacteria.**

**Scientists investigated whether two soils with a different pH contained different communities of nitrifying bacteria. These communities consist of all the nitrifying bacteria of different species in each soil. They took samples of soil from two sites, A and B.**

**They measured the pH of the samples and found that**

- the soil from site A had a pH of 6.9**
- the soil from site B had a pH of 4.3**

**The scientists measured the concentration of ammonia in soil samples over 20 days. Each sample contained the same concentration of ammonia at the start and had the same mass. They recorded the concentration of ammonia in**

- soil A with a pH of 6.9
- soil B with a pH of 4.3
- a mixture of equal masses of soils A and B with its pH adjusted to 6.9

Their results are shown in FIGURE 6.

The oxidation of ammonia by nitrifying bacteria involves the enzyme ammonia monooxygenase. Each species of nitrifying bacteria has its own specific *amoA* gene that codes for production of ammonia monooxygenase.

In a second investigation, the scientists determined the expression of the *amoA* gene in two species of bacteria, S and T. Species S was from acid soil and species T was from soil with a neutral pH.

The scientists grew cultures of each species separately in soils of different pH. They determined the amount of mRNA from the *amoA* gene in each culture.

Their results are shown in FIGURE 7, on page 57.
