At the top of the page, write your surname and other names, your centre number, your candidate number and add your signature.

[Turn over]
For this paper you must have:
• the Periodic Table/Data Booklet, provided as an insert (enclosed)
• a ruler with millimetre measurements
• a scientific calculator, which you are expected to use where appropriate.

INSTRUCTIONS

• Use black ink or black ball-point pen.
• Answer ALL questions.
• You must answer the questions in the spaces provided. Do NOT write on the blank pages.
• Do all rough work in this book. Cross through any work you do not want to be marked.
INFORMATION

• The marks for questions are shown in brackets.
• The maximum mark for this paper is 105.

DO NOT TURN OVER UNTIL TOLD TO DO SO
This question is about the reactions of alkanes.

Alkanes can be used as fuels.

Give an equation for the combustion of heptane \((\text{C}_7\text{H}_{16})\) in an excess of oxygen. [1 mark]
Heptane can be obtained from the catalytic cracking of hexadecane ($\text{C}_{16}\text{H}_{34}$) at a high temperature.

Identify a suitable catalyst for this process.

Give ONE condition other than high temperature.

Give an equation for the catalytic cracking of one molecule of hexadecane to produce one molecule of heptane, one molecule of cyclohexane and one other product. [3 marks]

<table>

Alkanes can be used in free-radical substitution reactions to produce halogenoalkanes.

Give equations for the propagation steps in the reaction of butane to form 2-chlorobutane. [2 marks]
Chlorofluorocarbons (CFCs) are a group of halogenoalkanes currently banned in many countries. They cannot be used as solvents or refrigerants because of their effect on the environment.

The structure of a CFC is shown.

Identify the radical produced from this CFC that is responsible for the depletion of ozone in the atmosphere.
Explain, with the aid of equations, why a single radical can cause the decomposition of many molecules of ozone. [4 marks]

Radical

Explanation
Halogenoalkanes are useful compounds in synthesis. A reaction pathway is shown.

**Reaction 1**

\[ \text{CH}_2(\text{OH})\text{CH}(\text{CH}_3)\text{CH}_2\text{Br} \rightarrow \text{CH}_2(\text{OH})\text{CH}(\text{CH}_3)\text{CH}_2\text{OH} \]

\[ \text{NaOH} \]

**Reaction 2**

\[ \downarrow \]

**Reaction 3**

\[ \text{Compound Z} \quad \text{Compound Y} \]

\[ \text{C}_4\text{H}_6\text{O}_2 \]
Give the IUPAC name for CH₂(OH)CH(CH₃)CH₂Br

[1 mark]
Reaction 1 occurs via a nucleophilic substitution mechanism.

Explain why the halogenoalkane is attacked by the nucleophile in this reaction. [3 marks]
The infrared spectrum of Compound Y shows a significant absorption in the range 1680–1750 cm$^{-1}$

Draw the displayed formula of Compound Y. [1 mark]
Compound Z has the empirical formula $C_3H_4NO$

Give the structure of Compound Z.

Suggest the reagent for Reaction 3. [2 marks]

Structure

Reagent for Reaction 3
The oxidation of propan-1-ol can form propanal and propanoic acid.

The boiling points of these compounds are shown in TABLE 1.

<table>

________________________________________________________________________

________________________________________________________________________
Compounds A and B react together to form an equilibrium mixture containing compounds C and D according to the equation

\[ 2A \ + \ B \rightleftharpoons 3C \ + \ D \]

A beaker contained 40 cm\(^3\) of a 0.16 mol dm\(^{-3}\) aqueous solution of A. 9.5 × 10\(^{-3}\) mol of B and 2.8 × 10\(^{-2}\) mol of C were added to the beaker and the mixture was left to reach equilibrium. The equilibrium mixture formed contained 3.9 × 10\(^{-3}\) mol of A.

Calculate the amounts, in moles, of B, C and D in the equilibrium mixture. [5 marks]
Amount of B  ________________________ mol
Amount of C  ________________________ mol
Amount of D  ________________________ mol

[Turn over]
Give the expression for the equilibrium constant ($K_c$) for this equilibrium AND its units. [2 marks]

$K_c$

Units

[Turn over]
A different equilibrium mixture of these four compounds, at a different temperature, contained 0.21 mol of B, 1.05 mol of C and 0.076 mol of D in a total volume of $5.00 \times 10^2$ cm$^3$ of solution.

At this temperature the numerical value of $K_c$ was 116

Calculate the concentration of A, in mol dm$^{-3}$, in this equilibrium mixture.

Give your answer to the appropriate number of significant figures. [3 marks]
Concentration of A \[\text{mol dm}^{-3}\]
Justify the statement that adding more water to the equilibrium mixture in Question 04.3 will lower the amount of A in the mixture. [3 marks]
Bromate(V) ions and bromide ions react in acid conditions according to the equation

\[
\text{BrO}_3^- (aq) + 5\text{Br}^- (aq) + 6\text{H}^+(aq) \rightarrow 3\text{Br}_2(aq) + 3\text{H}_2\text{O}(l)
\]

A series of experiments was carried out at a given temperature. The results were used to deduce the rate equation for the reaction.

\[
rate = k [\text{BrO}_3^-][\text{Br}^-][\text{H}^+]^2
\]

TABLE 2 shows an incomplete set of results.

</tbody>
</table>

Complete TABLE 3. [2 marks]
The Arrhenius equation can be written as

\[ \ln k = - \frac{E_a}{R} \left( \frac{1}{T} \right) + C_1 \]

In this experiment, the rate constant, \( k \), is directly proportional to \( \frac{1}{t} \)

Therefore

\[ \ln \frac{1}{t} = - \frac{E_a}{R} \left( \frac{1}{T} \right) + C_2 \]

where \( C_1 \) and \( C_2 \) are constants.

Use values from TABLE 3, on page 43, to plot a graph of \( \ln \frac{1}{t} \) (y axis) against \( \frac{1}{T} \) on the grid, on page 46.
Use your graph to calculate a value for the activation energy, in kJ mol\(^{-1}\), for this reaction.

The value of the gas constant, \( R = 8.31 \text{ J K}^{-1} \text{ mol}^{-1}\) [6 marks]

[Turn over]
Activation energy: \( \text{__________} \) kJ mol\(^{-1}\)

[Turn over]
Data about the hydrogenation of cyclohexene and of benzene are given.

\[ \text{O} + \text{H}_2 \rightarrow \text{O} \quad \Delta H^\circ = -120 \text{ kJ mol}^{-1} \]

\[ \text{O} + 3\text{H}_2 \rightarrow \text{O} \quad \Delta H^\circ = -208 \text{ kJ mol}^{-1} \]

Explain the bonding in and the shape of a benzene molecule. Compare the stability of benzene with that of the hypothetical cyclohexa-1,3,5-triene molecule. Use the data in your answer. [6 marks]
The enthalpy of hydrogenation of cyclohexa-1,3-diene is NOT exactly double that of cyclohexene.

Suggest a value for the enthalpy of hydrogenation of cyclohexa-1,3-diene and justify your value. [3 marks]
Acyl chlorides are useful reagents in synthesis. They react with aromatic compounds and also with alcohols.

\[ \text{CH}_3\text{CH}_2\text{COCl} \] reacts with benzene in the presence of AlCl\(_3\) in an electrophilic substitution reaction.

Give an equation for the reaction of \( \text{CH}_3\text{CH}_2\text{COCl} \) with AlCl\(_3\) to form the electrophile. Outline a mechanism for the reaction of this electrophile with benzene. [4 marks]
Equation
