Figure 1 shows water being heated. Eventually the water changed into steam.

Figure 1

Steam
Saucepan of water

Complete the sentences.
Choose answers from the box.
Each answer may be used once, more than once or not at all.

[2 marks]

The distance between the particles in steam is _____________________________ the distance between the particles in liquid water.

The density of steam is _____________________________ the density of liquid water.
Figure 2 shows how the temperature of the water varied with time.

Figure 2

What is the name of the process that is taking place between points A and B?

Give a reason for your answer. [2 marks]

<table>
<thead>
<tr>
<th>Process</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A mass of 0.063 kg of water was turned into steam.

The specific latent heat of vaporisation of water is 2 260 000 J/kg

Calculate the thermal energy transferred to the water to turn it into steam.

Use the equation:

\[
\text{thermal energy for a change of state} = \text{mass} \times \text{specific latent heat}
\]

[2 marks]

\[
\text{Energy} = \frac{0.063 \times 2 260 000}{\text{J}}
\]

Energy = ________________ J
The mass of the steam was 0.063 kg
The volume of the steam was 0.105 m$^3$

Calculate the density of steam.

Use the equation:

\[
\text{density} = \frac{\text{mass}}{\text{volume}}
\]

Choose the unit from the box.

[3 marks]

\[
\begin{array}{ccc}
\text{kg} & \text{m}^3 / \text{kg} & \text{kg} / \text{m}^3 \\
\hline
\text{Density} = & \text{Unit} \\
\end{array}
\]
Polonium-210 \(^{210}_{84}\text{Po}\) is a radioactive isotope that decays by emitting alpha radiation.

Which is the correct decay equation for polonium-210?

Tick (\(\checkmark\)) one box.

\[
\begin{align*}
^{210}_{84}\text{Po} & \rightarrow ^{214}_{86}X + ^{4}_{2}\text{He} \\
^{210}_{84}\text{Po} & \rightarrow ^{206}_{86}X + ^{4}_{2}\text{He} \\
^{210}_{84}\text{Po} & \rightarrow ^{206}_{82}X + ^{4}_{2}\text{He}
\end{align*}
\]

Why is alpha radiation dangerous inside the human body?

Tick (\(\checkmark\)) one box.

- Alpha radiation is electromagnetic radiation.
- Alpha radiation is highly ionising.
- Alpha radiation is very penetrating.

**Question 2 continues on the next page**
Figure 3 shows how the mass of a sample of polonium-210 changes with time.

Determine the change in mass of the sample of polonium-210 between 50 and 150 days.

[2 marks]

Change in mass = _________________ mg
02.4  Estimate the mass of polonium-210 remaining after 300 days.  

[1 mark]

Mass = _____________________ mg

02.5  Nuclear radiation can cause ionisation.

Complete the sentences.

Choose answers from the box.

[2 marks]

A negative    an electron    a neutron    a positive    a proton    a zero

An atom becomes an ion when it loses ___________________________.

The resulting ion has ___________________________ charge.

Turn over for the next question
Figure 4 shows a person sliding down a zip wire.

Describe how the vertical height of the tower could be measured accurately.

[2 marks]

When using the zip wire, the person moved through a vertical height of 2.0 m

The person has a mass of 45 kg

gravitational field strength = 9.8 N/kg

Calculate the change in gravitational potential energy of the person.

Use the equation:

\[ \text{gravitational potential energy} = \text{mass} \times \text{gravitational field strength} \times \text{height} \]

[2 marks]

Change in gravitational potential energy = \[ \text{J} \]
Give three factors that affected the kinetic energy of the person as she reached the bottom of the zip wire.

[3 marks]

1. 

2. 

3. 

Turn over for the next question
The ancient Greeks thought that atoms were tiny spheres that could not be divided into anything smaller.

Since then, different discoveries have led to the model of the atom changing. Some of the discoveries are given in Table 1.

**Table 1**

<table>
<thead>
<tr>
<th>Description</th>
<th>Letter</th>
</tr>
</thead>
<tbody>
<tr>
<td>The mass of an atom is concentrated in the nucleus.</td>
<td>A</td>
</tr>
<tr>
<td>Electrons orbit the nucleus at specific distances.</td>
<td>B</td>
</tr>
<tr>
<td>The nucleus contains neutrons.</td>
<td>C</td>
</tr>
<tr>
<td>The nucleus contains positively charged protons.</td>
<td>D</td>
</tr>
</tbody>
</table>

Which discovery was the earliest? [1 mark]

Tick (✓) one box.

A [ ] B [ ] C [ ] D [ ]

Which discovery was the most recent? [1 mark]

Tick (✓) one box.

A [ ] B [ ] C [ ] D [ ]
The alpha particle scattering experiment led to the nuclear model of the atom.

**Figure 5** shows the paths of alpha particles travelling close to a gold nucleus.

**Figure 5**

Alpha particles

Gold nucleus

Complete the sentences.

Choose answers from the box.

Each answer may be used once, more than once or not at all.

</table>

Alpha particles and gold nuclei are both positively charged.

The gold nucleus __________________________ the alpha particles.

As the alpha particle approaches the gold nucleus, the electric field strength experienced by the alpha particle __________________________.

As an alpha particle approaches the gold nucleus, the force experienced by the alpha particle __________________________.
The results of the alpha particle scattering experiment were reproducible. What does reproducible mean? Tick (✓) one box.

Another scientist repeats the experiment and gets the same results.

Another scientist repeats the experiment and gets different results.

The same scientist repeats the experiment and gets the same results.

The same scientist repeats the experiment and gets different results.
Figure 6 shows how different energy resources were used in the United Kingdom (UK) to generate electricity on one day in June 2018.

The UK government plans to stop using coal-fired power stations by 2025.

Explain one environmental problem caused when electricity is generated by burning coal.

[2 marks]

Give two renewable energy resources that could make up the 'Other' energy resources in Figure 6.

[2 marks]

1

2
05.3 Determine the percentage of electricity generated in nuclear power stations that day.

Use data from Figure 6.

[2 marks]

Percentage of electricity generated in nuclear power stations = _________ %

Question 5 continues on the next page
Figure 7 shows how the demand for electricity varied with the time of day.

Figure 7

![Graph showing demand for electricity]

What was the difference between the maximum demand and minimum demand for electricity during this day?

0 5 4

Difference = _______________ MW
**Figure 7** shows that the demand for electricity increased between 06:00 and 09:00.

Solar power could have met the demand if there were enough solar panels installed in the UK.

Explain why.

[2 marks]

___________________________________________________________________________

___________________________________________________________________________

___________________________________________________________________________

Turn over for the next question
An electric car has a motor that is powered by a battery.

A diesel car has an engine that is powered by diesel fuel.

**Table 2** compares an electric car and a diesel car.

<table>
<thead>
<tr>
<th>Power source</th>
<th>Maximum acceleration in m/s²</th>
<th>Mass of power source in kg</th>
<th>Range in km</th>
<th>Maximum power output in kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery</td>
<td>4.8</td>
<td>420</td>
<td>220</td>
<td>200</td>
</tr>
<tr>
<td>Diesel fuel</td>
<td>3.2</td>
<td>51</td>
<td>1120</td>
<td>120</td>
</tr>
</tbody>
</table>

Give **two** advantages of the diesel car compared with the electric car in **Table 2**. [2 marks]

1

2

The mass of the battery in the electric car is 420 kg

The total mass of the electric car is 1610 kg

Calculate the mass of the battery as a percentage of the total mass of the electric car. [2 marks]

Percentage of total mass = ____________________ %
Designers of electric car batteries want to increase the amount of energy that can be stored in a battery.

Suggest two reasons why.

1. 

2. 

Figure 8 shows an electric car being recharged.

Write down the equation which links energy transferred, power and time.

The charger has a power output of 7000 W

Calculate the time taken to transfer 420 000 J of energy to the car battery.
Figure 9 shows a circuit diagram.

In which position could a switch be placed so that both lamps can be switched on or off at the same time?

[1 mark]

Tick (✓) one box.

J    K    L    M

Draw the circuit symbol for a switch in the box below.

[1 mark]
In 30 seconds, 24 coulombs of charge flow through the battery.

Calculate the current in the battery.

Use the equation:

\[
\text{current} = \frac{\text{charge flow}}{\text{time}}
\]

[2 marks]

\[\text{Current} = \text{___________} \text{ A}\]

There is a potential difference of 3.6 V across the battery.

Calculate the energy transferred by the battery when 60 coulombs of charge flows through the battery.

Use the equation:

\[
\text{energy transferred} = \text{charge flow} \times \text{potential difference}
\]

[2 marks]

\[\text{Energy transferred} = \text{___________} \text{ J}\]

Question 7 continues on the next page
A student built Circuit X and Circuit Y shown in Figure 10. The components used in each circuit were identical.

Figure 10

How would the reading on the ammeter in Circuit Y compare to the reading on the ammeter in Circuit X?

Tick (✓) one box.

The reading in Y would be higher.

The reading in Y would be lower.

The readings would be the same.

How does the total resistance of Circuit Y compare with the total resistance of Circuit X?

Tick (✓) one box.

The total resistance of Y is greater.

The total resistance of Y is less.

The total resistance is the same.
The student built another circuit which is shown in **Figure 11**.

**Figure 11**

![Circuit Diagram](image)

07.7 Write down the equation which links current, potential difference and resistance.  

[1 mark]

07.8 There is a potential difference of 3.6 V across the lamp in **Figure 11**.  
The current through the lamp is 0.80 A  

Calculate the resistance of the lamp.  

[3 marks]

Resistance = \( \frac{V}{I} \)  

\[ \text{Resistance} = \frac{3.6}{0.80} \Omega \]

**Turn over for the next question**
A student carried out an experiment to determine the specific heat capacity of water.

Figure 12 shows the equipment the student used to heat the water.

**Figure 12**

Power supply  Joulemeter  Insulated beaker of water

1. Why did the student insulate the beaker of water?

   Tick (√) one box.

   - To increase energy transfer to the surroundings.
   - To reduce energy transfer to the surroundings.
   - To stop energy transfer to the surroundings.

2. One hazard in this experiment is the hot water.

   Give one risk to the student caused by this hazard.

   [1 mark]

   ________________________________________________________________
   ________________________________________________________________
Figure 13 shows the thermometer that the student used.

Figure 13

What is the resolution of the thermometer? [1 mark]

Tick (✓) one box.

1 °C

3 °C

19 °C

Question 8 continues on the next page
**Figure 14** shows the beaker of water on a balance.

The mass of the water was 0.20 kg

What was the mass of the beaker?

[1 mark]

Tick (✓) one box.

- 0.06 kg
- 0.20 kg
- 0.26 kg
- 0.46 kg
The energy transferred to the water was 26 400 J

The mass of water was 0.20 kg

The temperature increase of the water was 30 °C

Calculate the specific heat capacity of water using the data from this experiment.

Use the Physics Equations Sheet.

Choose the unit from the box.

[4 marks]

Specific heat capacity = __________________________ Unit ___________

Turn over for the next question
Light bulbs are labelled with a power input.

What does power input mean?  

Tick (✓) one box.

- The charge transferred each second by the bulb.  
- The current through the bulb.  
- The energy transferred each second to the bulb.  
- The potential difference across the bulb.  

Write down the equation which links current, potential difference and power.  

A light bulb has a power input of 40 W

The mains potential difference is 230 V

Calculate the current in the light bulb.

Current = ___________________________ A
Table 3 shows information about three different light bulbs.

<table>
<thead>
<tr>
<th>Light bulb</th>
<th>Total power input in watts</th>
<th>Useful power output in watts</th>
<th>Efficiency</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>6.0</td>
<td>5.4</td>
<td>0.90</td>
</tr>
<tr>
<td>Q</td>
<td>40</td>
<td>2.0</td>
<td>0.05</td>
</tr>
<tr>
<td>R</td>
<td>9.0</td>
<td>X</td>
<td>0.30</td>
</tr>
</tbody>
</table>

Write down the equation which links efficiency, total power input and useful power output.

[1 mark]

Calculate the value of X in Table 3.

[3 marks]

\[ X = \underline{\phantom{1234567890}} \text{ W} \]

In addition to power input, light bulbs should also be labelled with the rate at which they emit visible light.

Suggest why.

[2 marks]
A student investigated the insulating properties of newspaper.

**Figure 15** shows the apparatus the student used.

**Figure 15**

- Digital thermometer
- Metal can
- Hot water
- Layers of newspaper

The student’s results are shown in **Figure 16**.

**Figure 16**

- Temperature decrease of the water after 5 minutes in °C
- Number of layers of newspaper
Describe a method the student could have used to obtain the results shown in Figure 16. 

[6 marks]
The student could have used a datalogger with a temperature probe instead of the digital thermometer.

**Figure 17** shows the readings on the digital thermometer and the datalogger.

**Figure 17**

- **Digital thermometer**: 67.5 °C
- **Datalogger**: 67.5 °C

The datalogger records 10 readings every second.

The student considered using a temperature probe and datalogger.

Explain why it was not necessary to use a temperature probe and datalogger for this investigation.

[2 marks]
A scientist investigated how the maximum muscle power of humans varies with age and gender.

The scientist asked volunteers to stand on a platform and to jump as high as they could.

Figure 18 shows a volunteer taking part in the experiment.

![Figure 18](image)

An electronic timer measured the time that the volunteer was in the air.

The muscle power in watts per kg is calculated using the following equation:

\[
\text{muscle power} = \frac{9.8 \times \text{jump height}}{\text{time}}
\]

One volunteer has a muscle power of 41 W/kg

He was in the air for 0.12 s

Calculate his jump height.

\[\text{Jump height} = \quad \mathrm{m}\]
11.2 Write down the equation which links kinetic energy, mass and speed.

[1 mark]

\[ KE = \frac{1}{2}mv^2 \]

11.3 One volunteer had a kinetic energy of 270 J and a speed of 3.0 m/s at the moment he left the ground.

Calculate his mass.

[3 marks]

\[ KE = \frac{1}{2}mv^2 \]

\[ 270 = \frac{1}{2}m(3.0)^2 \]

\[ m = \frac{270 \times 2}{9} \]

\[ m = 60 \text{ kg} \]

Mass = 60 kg

Figure 19 shows the scientist’s results.
11.4 Compare the muscle power of males with the muscle power of females.

Use data from Figure 19 in your answer. [4 marks]
