HT = Higher Tier only equations

|  |                                |
|--|--------------------------------|
| kinetic energy = $0.5 \times \text{mass} \times (\text{speed})^2$                              | $E_k = \frac{1}{2} m v^2$      |
| elastic potential energy = $0.5 \times \text{spring constant} \times (\text{extension})^2$     | $E_e = \frac{1}{2} k e^2$      |
| gravitational potential energy =<br>mass $\times$ gravitational field strength $\times$ height | $E_p = m g h$                  |
| change in thermal energy =<br>mass $\times$ specific heat capacity $\times$ temperature change | $\Delta E = m c \Delta \theta$ |
| power = $\frac{\text{energy transferred}}{\text{time}}$  | $P = \frac{E}{t}$              |
| power = $\frac{\text{work done}}{\text{time}}$   | $P = \frac{W}{t}$              |
| efficiency = $\frac{\text{useful output energy transfer}}{\text{total input energy transfer}}$ |                                |
| efficiency = $\frac{\text{useful power output}}{\text{total power input}}$                     |                                |

|  |                      |
|--|----------------------|
| charge flow = current × time   | $Q = I t$            |
| potential difference = current × resistance                            | $V = I R$            |
| power = potential difference × current                                 | $P = V I$            |
| power = (current) <sup>2</sup> × resistance                            | $P = I^2 R$          |
| energy transferred = power × time                                      | $E = P t$            |
| energy transferred = charge flow × potential difference                | $E = Q V$            |
| potential difference across primary coil × current in primary coil =   | $V_p I_p = V_s I_s$  |
| potential difference across secondary coil × current in secondary coil |                      |
| density = $\frac{\text{mass}}{\text{volume}}$                          | $\rho = \frac{m}{V}$ |

HT

|  |                          |
|--|--------------------------|
| thermal energy for a change of state =<br>mass × specific latent heat                            | $E = m L$                |
| weight = mass × gravitational field strength   | $W = m g$                |
| work done = force × distance (along the line of action of the force)                             | $W = F s$                |
| force = spring constant × extension  | $F = k e$                |
| distance travelled = speed × time  | $s = v t$                |
| acceleration = $\frac{\text{change in velocity}}{\text{time taken}}$                             | $a = \frac{\Delta v}{t}$ |
| (final velocity) <sup>2</sup> – (initial velocity) <sup>2</sup> =<br>2 × acceleration × distance | $v^2 - u^2 = 2 a s$      |
| resultant force = mass × acceleration  | $F = m a$                |

|  |                   |
|--|-------------------|
| <p><b>momentum = mass × velocity</b></p>   | $p = m v$         |
| <p><b>period = <math>\frac{1}{\text{frequency}}</math></b></p>   | $T = \frac{1}{f}$ |
| <p><b>wave speed = frequency × wavelength</b></p>  | $v = f \lambda$   |
| <p><b>force on a conductor (at right angles to a magnetic field) carrying a current = magnetic flux density × current × length</b></p> | $F = B I l$       |
