## GCSE

## COMPUTER SCIENCE

## Paper 1 Computational thinking and programming skills - C\#

Friday 19 May 2023

## Afternoon

Time allowed: 2 hours

## Materials

- There are no additional materials required for this paper.
- You must not use a calculator.

## Instructions

- Use black ink or black ball-point pen. Use pencil only for drawing.
- Answer all questions.
- You must answer the questions in the spaces provided.
- If you need extra space for your answers), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.
- Questions that require a coded solution must be answered in C\#.
- You should assume that all indexing in code starts at 0 unless stated otherwise.

## Information

The total number of marks available for this paper is 90 .

## Advice

Figure 3 shows a program written in C\# that calculates the area of a rectangle or the volume of a box from the user inputs.

Figure 3

```
public static int calculate(int width, int length,
int height) {
        if (height == -1)
        {
            return width * length;
    } else
    {
        return width * length * height;
    }
}
public static void Main() {
    int numOne, numTwo, numThree, answer;
    Console.Write("Enter width: ");
    numOne = Convert.ToInt32(Console.ReadLine());
    Console.Write("Enter length: ");
    numTwo = Convert.ToInt32(Console.ReadLine());
    Console.Write("Enter height, -1 to ignore: ");
    numThree = Convert.ToInt32(Console.ReadLine());
    answer = calculate(numOne, numTwo, numThree);
    if (numThree == -1)
    {
        Console.WriteLine($"Area {answer}");
    } else
    {
        Console.WriteLine($"Volume {answer}");
    }
}
```

| 0 | 6 |
| :--- | :--- |

The algorithm is for a simple authentication routine.
The pseudo-code uses a subroutine getPassword to check a username:

- If the username exists, the subroutine returns the password stored for that user.
- If the username does not exist, the subroutine returns an empty string.

Parts of the algorithm are missing and have been replaced with the labels $\operatorname{L1}$ to L4.
Figure 5

```
login \leftarrow False
REPEAT
    username < ''
    WHILE username = ''
        OUTPUT 'Enter username: '
        username \leftarrow L1
    ENDWHILE
    password < ''
    WHILE password = ''
        OUTPUT 'Enter password: '
        password < USERINPUT
    ENDWHILE
    storedPassword < getPassword(L2)
    IF storedPassword = L3 THEN
        OUTPUT ' L4 '
    ELSE
        IF password = storedPassword THEN

| $\mathbf{0}$ | $\mathbf{7}$ | A theme park charges $£ 15$ per person for a daily ticket. If there are six or more |
| :--- | :--- | :--- | people in a group, the group is given a $£ 5$ discount.

Write a C\# program to calculate the total charge for a group of people visiting the theme park.

The program must:

- get the user to enter the number of people in a group
- calculate the total charge by:
- charging $£ 15$ per person
- reducing the total charge by $£ 5$ if there are six or more people
- output the total charge.

You should use meaningful variable name(s) and C\# syntax in your answer.
The answer grid below contains vertical lines to help you indent your code.

Figure 8 shows an algorithm, written using pseudo-code, that uses a RECORD data structure for storing information about a film.

Each record stores four pieces of information about a film:

- film title
- certificate (eg 12A, PG)
- year the film was made
- if the film is currently being shown at a cinema.

There are records for three films and these films are stored alphabetically in an array called filmCollection.

The pseudo-code outputs the title of the newest of the three films.

- Part of the algorithm has been replaced by the label L1.

Figure 8

```
RECORD Film
    title : String
    certificate : String
    year : Integer
    beingShown : Boolean
ENDRECORD
hulk \leftarrow Film('Hulk', '12A', 2005, False)
ironMan < Film('Iron Man', '12A', 2008, False)
antMan < Film('Ant-Man', '12A', 2015, False)
filmCollection < [antMan, hulk, ironMan]
year \leftarrow < 0
position < 0
FOR i \leftarrow 0 TO L1
    IF filmCollection[i].year > year THEN
        year \leftarrow filmCollection[i].year
        position < i
    ENDIF
ENDFOR
OUTPUT filmCollection[position].title, ' is the
newest film'
```

| $\mathbf{0}$ | $\mathbf{9}$. | $\mathbf{1}$ How many different values can the field beingShown have? |

| :--- | :--- | :--- | Shade one lozenge.

A hulk.year $\leftarrow 2003$
B filmCollection[0].year $\leftarrow 2003$

C Film(year) $\leftarrow 2003$
D hulk(year) $\leqslant 2003$

| 0 | 9 | 3 |
| :--- | :--- | :--- | What should the label L 1 in Figure 8 be replaced by? Shade one lozenge.

A 3

B LEN(filmCollection)

C LEN(filmCollection) - 1

D Position

| $\mathbf{0}$ | $\mathbf{9} .4$ | Write a pseudo-code statement that updates the antMan record to show that the film |
| :--- | :--- | :--- | :--- | is currently being shown at the cinema.

| 1 | 0 | Figure 9 shows an algorithm, represented in pseudo-code, used to display students' |
| :--- | :--- | :--- | test scores. The algorithm does not work as expected and the teacher wants to find the error.

The algorithm should display three test scores for each student:

- Natalie has results of 78, 81 and 72
- Alex has results of 27,51 and 54
- Roshana has results of 52,55 and 59 .
- Line numbers are included but are not part of the algorithm.

Figure 9

```
1 names \leftarrow ['Natalie', 'Alex', 'Roshana']
2 scores < [78, 81, 72, 27, 51, 54, 52, 55, 59]
3 count }\leftarrow
4 FOR i }\leftarrow0 TO 2,
5 person \leftarrow names[i]
6 OUTPUT 'Student: ', person
7 FOR j < O TO 1
8 OUTPUT j + 1
9 result \leftarrow scores[i * 3 + j]
10 OUTPUT result
11 count & count + 1
12 ENDFOR
13 ENDFOR
```

| 1 | 0 | 1 | Complete the trace table for the algorithm shown in Figure 9. |
| :--- | :--- | :--- | :--- |

You may not need to use all the rows in the table.

| count | i | person | j | result |

| $\mathbf{1}$ | $\mathbf{0}$ | $\mathbf{2}$ How could the error in the algorithm in Figure 9 be corrected? |
| :--- | :--- | :--- |

Shade one lozenge.

A Change line number 3 to: count $\leftarrow-1$
B Change line number 4 to: $\operatorname{FOR}$ i $\leftarrow 1$ TO 4
C Change line number 7 to: FOR j $\leftarrow 0$ TO 20
D Change line number 9 to: result $\leftarrow \operatorname{scores}[j * 3+i] \quad 0$

## Turn over for the next question

| 1 | 1 | Figure 10 shows part of an algorithm that has been written in pseudo-code. |
| :--- | :--- | :--- |

There is an error in the algorithm.
The algorithm should:

- get the start year and end year from the user
- check that the start year is before the end year
- check that the start year is before 2000
- calculate the difference between the two years after a valid start year has been entered.
- Line numbers are included but are not part of the algorithm.

Figure 10

```
validChoice < False
REPEAT
    difference < -1
    OUTPUT 'Enter a start year '
    startYear & USERINPUT
    OUTPUT 'Enter an end year '
    endYear \leftarrow USERINPUT
    IF startYear \geq endYear THEN
        OUTPUT 'Start year must be before end year'
    ELSE
        IF startYear < 2000 THEN
                OUTPUT 'Start year must be before 2000'
        ELSE
            validChoice < True
        ENDIF
        ENDIF
        UNTIL validChoice = True
        18 difference < endYear - startYear
        19 OUTPUT difference
```

| 1 | 1 | 1 |
| :--- | :--- | :--- |

Complete the table to show what the values of the validChoice and difference variables would be for the given test data.

Table 1

| Test type | Test data |  | validChoice | difference |
| :--- | :--- | :--- | :--- | :--- |
| Normal | startYear | 1995 |  |  |
|  | endYear | 2010 |  |  |
|  | startYear | 2015 |  |  |
|  | endYear | 2000 |  |  |
| Boundary | startYear | 2000 |  |  |
|  | endYear | 2023 |  |  |

| 1 | 1 | 2 |
| :--- | :--- | :--- |

Describe how the error on line 11 can be corrected.
$\qquad$

Turn over for the next question

| 1 | 2 | 1 | Figure 11 shows a binary search algorithm that has been programmed in CH . |
| :--- | :--- | :--- | :--- |

The CompareTo method is used to compare two strings. It returns:

- -1 if the first string is less than the second
- 0 if the first string is equal to the second
- 1 if the first string is greater than the second.

Figure 11

```
string[] animals = {"cat", "dog", "hippo", "llama",
"ox", "rat", "tiger", "wolf"};
Console.Write("What animal would you like to find? ");
string animalToFind = Console.ReadLine();
bool validAnimal = false;
int start = 0;
int finish = animals.Length - 1;
while (validAnimal == false && start <= finish) {
    int mid = (start + finish) / 2;
    if (animals[mid] == animalToFind) {
        validAnimal = true; }
    else if (animalToFind.CompareTo(animals[mid]) == 1)
    {
        start = mid + 1;
    } else {
        finish = mid - 1;
    }
}
Console.WriteLine(validAnimal);
```

Complete the trace table for the program in Figure 11 if the user input is wolf
Part of the table has already been filled in.
You may not need to use all the rows in the table.
[4 marks]

| animalToFind | validAnimal | start | finish | mid |
| :---: | :---: | :---: | :---: | :---: |

| 1 | 2 | 2 |
| :--- | :--- | :--- |

Figure 12

```
string[] fruits = {"banana", "apple", "orange",
    "pear", "grape", "pineapple"};
```

Extend the program in Figure 12. Your answer must be written in C\#.

The program should get the user to enter a word and perform a linear search on the array fruits to find if the word is in the array or not.

The program should:

- ask the user what word they would like to find
- output the message True if the word is found
- output the message False if the word is not found.

You must write your own linear search routine and not use any built-in search function available in C\#.

You should use meaningful variable name(s) and C\# syntax in your answer.
The answer grid below contains vertical lines to help you indent your code.

```
string[] fruits = {"banana", "apple", "orange",
    "pear", "grape", "pineapple"};
```

|  |  |  |  |  |

Question 12 continues on the next page

|  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |

| $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ State why a binary search cannot be used on the array fruits |
| :--- | :--- | :--- | :--- |

| 1 | 2 | 4 | Figure 13 shows an algorithm, represented using pseudo-code, that should display |
| :--- | :--- | :--- | :--- | currency names in reverse alphabetical order, starting with yen.

There are errors in the logic of the algorithm.

- Line numbers are included but are not part of the algorithm.

Figure 13
1 SUBROUTINE diffCurrencies(currencies)
currencies $\leftarrow ~[' b a h t ', ~ ' d o l l a r ', ~ ' e u r o ', ~$
2 'koruna', 'lira', 'rand', 'rupee', 'yen']
3 RETURN currencies[x]
4 ENDSUBROUTINE
5
6 FOR i $\leftarrow 8$ TO 0 STEP 1
7 OUTPUT(diffCurrencies(i))
8 ENDFOR

Rewrite line 1 and line 6 from Figure 13 to make the algorithm work as intended.

Line 1 $\qquad$
$\qquad$
Line 6 $\qquad$

Turn over for the next question

| 1 | 3 | A programmer is writing a game. The game uses a $3 \times 3$ grid containing nine |
| :--- | :--- | :--- | squares.

Figure 14

In the game, a square on the grid is referred to by a letter and a number. For example, square C3 in Figure 14 contains an X .

Figure 15 shows part of a C\# program that checks the grid reference entered by a player.
The grid reference is valid if:

- there are exactly two characters
- the first character entered is $\mathrm{A}, \mathrm{B}$ or C
- the second character entered is 1,2 or 3 .

Figure 15

```
bool check = false;
while (check == false) {
    string square = "";
    while (square.Length != 2) {
        Console.Write("Enter grid reference (eg C2): ");
        square = Console.ReadLine();
        square = square.ToUpper();
    }
```

The C\# function ToUpper ( ) converts letters into uppercase, eg b1 would be converted to B1

Extend the program from Figure 15 so it completes the other checks needed to make sure a valid grid reference is entered.

Your extended program must:

- use the variable check
- repeat the following steps until a valid grid reference is entered:
- get the user to enter a grid reference
- output an appropriate message if the grid reference entered is not valid.

You should use meaningful variable name(s) and C\# syntax in your answer.
The answer grid contains vertical lines to help you indent your code.

| 1 | 4 |
| :--- | :--- |

Figure 16 shows an incomplete algorithm, represented using pseudo-code, designed to output the highest or lowest results of the vote.

The programmer has used a two-dimensional array called results to store the genre and the number of votes for each genre.

Parts of the algorithm are missing and have been replaced with the labels L1 to L3.
Figure 16

```
SUBROUTINE showResults(method, numberOfGenres)
    results \leftarrow [['Pop', 'Post-Punk', 'Techno', 'Metal',
        'Dance'], ['7', '19', '14', '1', '9']]
    pos < < 
    high \leftarrow -1
    IF method = 'HIGHEST' THEN
        FOR i < 0 TO numberOfGenres - 1
        Votes \leftarrow STRING_TO_INT(results[I1][i])
        IF votes > high THEN
                high \leftarrow votes
                pos < L2
                ENDIF
        ENDFOR
    ELSE
        OUTPUT 'not yet working'
    ENDIF
    IF high f -1 THEN
        OUTPUT results[0][pos], ' with ', results[1][pos]
    ENDIF
ENDSUBROUTINE
```

```
OUTPUT 'Show the genre with the HIGHEST or LOWEST number
of votes?
method \leftarrow USERINPUT
showResults( L3, 5)
```

State what should be written in place of the labels L1 to L3 in the algorithm in Figure 16.

L1)
(12)

L3

Turn over for the next question

| 1 | 5 |
| :--- | :--- | A group of people have a meal in a restaurant. Instead of one person paying for the whole meal, each person will pay for what they eat.

Write a C\# program that asks each person in the group how much they are paying towards the meal and works out when the bill is fully paid. Each person can pay a different amount.

The program should:

- get the user to enter the total amount of the bill
- get a person to enter how much they are paying towards the bill
- subtract the amount entered from the bill:
- if the amount left to pay is more than 0 , output how much is left to pay and repeat until the amount left to pay is 0 or less
- if the amount left to pay is 0 , then output the message Bill paid
- if the amount left to pay is less than 0, then output the message Tip is and the difference between the amount left to pay and 0

You should use meaningful variable name(s) and C\# syntax in your answer.
The answer grid below contains vertical lines to help you indent your code.

|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

| 1 | 6 | Question 16 is about a dice game played against a computer. |
| :--- | :--- | :--- |

The aim of the game is to get as close to a score of 21 as you can, without going over 21. If your score goes over 21 then you lose.

The player's score starts at 0 .
For each turn:

- two dice (each numbered from 1 to 6 ) are rolled
- the total of the two dice rolls is added to the player's score
- the value of each dice and the player's new total score is output
- if the current score is less than 21, the player is asked if they would like to roll the dice again: if the player says yes, they get another turn; otherwise, the game ends.

At the end of the game, the program should work as follows:

- if the final score is 21 , output a message to say the player has won
- if the final score is greater than 21 , output a message to say the player has lost
- if the final score is less than 21 , the program generates a random number between 15 and 21 inclusive:
- if this random number is greater than the player's final score, output a message to say the player has lost
- otherwise, output a message to say the player has won.

Figure 17 shows the output of a program that plays this dice game.

```

Write a C\# program to simulate this game.
The first line has been written for you in the answer grid.

The dice rolls are carried out by the program generating random numbers between 1 and 6 . You will need to use the C\# function $r$. Next ( $a, ~ b$ ) which generates a random integer in the range a to b starting at a but finishing one before b .

You should use meaningful variable name(s) and C\# syntax in your answer.
The answer grid below contains vertical lines to help you indent your code.
[11 marks]
Random $r=$ new Random();
